Subject: Automotive Maintenance Products

Comment:

I take pride in maintaining my vehicles and are concerned about negative impact that these standards may have on my ability to find products that work for a given project.

I am also concerned that these new requirements could increase the time and cost that is necessary for me to maintain my vehicles.

Further, I am concerned that the ARB did not consider the impact of these standards on vintage vehicles that still have carburetors and require effective products to ensure that they remain operational in the years to come.

Due to these concerns we urge the ARB to reconsider its 10% VOC standards, and finally consider a compromise, to avoid the negative cost and performance consequences that could result for automotive enthusiasts and DIY consumers.

Subject: VOC Standards for Brake Cleaners and other Products

Comment:

I am concerned that the ARB's proposed 10% VOC standards for Brake Cleaners, Carburetor or Fuel-Injection Air Intake Cleaners, Engine Degreasers, and General Purpose Degreasers could prevent or hinder me from effectively cleaning and maintaining my classic vehicles.

Further, I am concerned that the ARB did not consider the impact of these standards on vintage vehicles that still have carburetors and require effective products to ensure that they remain operational in the years to come. Carburetors that are allowed to become dirty and clogged would cause more pollution than the proposed limits would prevent.

Finally, I believe that in an effort to find home-brewed solutions, people might use unsafe chemicals like gasoline, kerosene, and other dangerous solvents instead of safe, tested labeled cleaners available today, again, not only negating any benefit of reduced VOC products, but adding to the risk of fire and injury.

Sincerely,
David Riker

Subject: Requesting this nonsense to stop

Comment:

I am a hard core Environmentalist and believe that we need to protect the Earth before it is too late. But government or an entity taking some thing over is against the principles this Country was founded on. Why render some thing which is necessary for the well being of the vehicles and the occupant's and their safety as useless? The autos engine is the most important part of the car. Leaving grease and grime on it can cause over heating and other severe problems. The intakes need to also to be kept clean so the car is running on clean air. This allows the engine to run in the best way, and for the longest. These are just a coupe out of the many reasons that cleaners need to be effective. I know this form the year of auto training and lots of experiences. The poor only have so much money, and for them to keep on getting a car because it can not be maintained properly do to your actions would be horrific. Please work with the manufacture to reduce V.O.C. but still have an effective product. I do apologize if I am to blunt, but this does out rage me.

Sincerely,
Adriel Rowley

Comment:

ARB,

I sure wish that you'd consider us vintage car owners in reducing the VOC's to 10%. It'll make maintenance more time consuming and expensive.

I'd prefer seeing the 55mph limit returned and enforced. This would be extremely unpopular but would not only make our roads safer and make a positive contribution to air quality. I am a CDL "big rig" licensed driver and have felt for a long time that the differential speed limits in California are a major hazzard to all drivers.

With respect, Russ.

RE: Air Resources Board's Third Staff Proposal for Regulation Changes to the Consumer Products Regulation at the November 16 Board Hearing

Dear Mr. Mallory and Ms. Yee:

The Adhesive and Sealant Council, Inc. (ASC) is a North American based trade association representing 120 manufacturers of adhesives and sealants and suppliers of raw materials to the industry.

As you are aware ASC and its members have been working with you and others on the Air Resources Board (ARB) staff for several months to revise the volatile organic content limit for the category of construction, panel and floor covering adhesives in the California consumer products regulation. After reviewing the ARB's third staff proposal issued on August 25, it is the agreement of ASC's manufacturing members that a limit of 7 percent for this category is technologically achievable.

It should be noted that within the industry concerns remain with regard to subfloor adhesives at this reduced level being used to bond some of the new technological materials that either exhibit low surface energy or building materials that have been chemically treated to resist mold or pest infestation. As in the past adhesive manufacturers will continue working in the area of research and development to meet the challenges this new lower limit will present for these particular types of applications.

In addition, manufacturers recognize ARB's interest in eliminating the three chlorinated compounds: methylene chloride,

perchloroethylene and trichloroethylene from this product category. Allowing for the continued use of these compounds in the manufacturing process

Page 2
October 12, 2006

through December 2008 with a sell-through provision of December 2011 that permits a systematic inventory reduction seems to be a reasonable approach to the eventual elimination of the compounds from this product category.

As always, it has been my pleasure to work with you and your staff in developing a reasonable new limit for this category and I look forward to continuing this effort as we begin to address the caulk and sealant category later this year.

Best regards,

Mark Collatz
Director of Government Relations
Adhesive and Sealant, Council, Inc.

Comment:

To the ARB Board:

I believe that the proposed 10% standard on automotive brake cleaners, degreasers, carb cleaners and general degreasers will lead to products that don't work very well. This reduction from 45% VOC to 10% VOC on an already-regulated product category will cause the users of these products to either:

use more
seek alternative products
make do with poor performance. This is not a good option when we are speaking of brake work.

Please re-consider.

Sincerely,

Michael Zimmerman
General Manager of Permatex

Subject: new C.A.R.B. VOC proposals

Comment:

Please stop destroying the automotive aftermarket industry, per your proposals on the VOC reduction in automotive chemical products! It is merely another veiled attempt by C.A.R.B. to hurt this industry in the guise of being "environmentally sound". People outside of California do not support this banter! Help us now by removing this proposed change that will only hurt the chemical manufacturers and in turn hurt us, the consumers who use these products.

By proposing a 10% reduction in VOC's, you will not stop their effects at all! You will simply cause us to have to use more of the product to achieve the same effectiveness, and therefore purchase more of it to do so. It's nothing more than symantics, and therefore a "lose-lose" situation!

Your proposal is wrong for the automotive industry as a whole! Please, stop it NOW!

Sincerely,
Jason Toups
DIY'er and concerned consumer.

Subject: Unreasonable 10% VOC Standards for Automotive Maintenance Products

Comment:

October 19, 2006

David Mallory, P.E.

Manager, Measures Development Section, Stationary Source Division

California Air Resources Board

P.O. Box 2815

Sacramento, CA 95812

Re: Unreasonable 10% VOC Standards for Automotive Maintenance Products

Dear Mr. Mallory:

The Florida Chemical Company and its 45 employees are very concerned about the Air Resources Board's (ARB's) 10 % VOC emission standards for the four automotive maintenance product categories in the proposed 2006 Amendments to California's Consumer Products Regulation.

The proposed 10% VOC standard for Brake Cleaners, Carburetor or Fuel-Injection Air Intake Cleaners, Engine Degreasers, and General Purpose Degreasers will destroy the ability to manufacture automotive maintenance products that are used to effectively clean and maintain vehicles.

Florida Chemical Company manufactures and markets a variety of citrus by-products that are useful to companies manufacturing products in these categories for sale in California. The impact of these standards would negatively impact automotive maintenance personnel, classic automobile enthusiasts, and anyone who owns or operates a motor vehicle in California. Proper vehicle maintenance is essential to maintaining the safety of automobiles and the proper wear of automotive parts like brakes, carburetors, engines, and others.

Specifically, Florida Chemical is concerned that the ARB has not considered the potential hazards that may be caused by residues on automotive brake parts or other vital automotive parts. We are also concerned that the proposed standards will increase costs to the automotive service industry and to consumers due to the additional time required for brake jobs and other degreasing operations from additional drying time and less effective products. Florida Chemical is also concerned that the ARB has not considered benefits of effective engine maintenance in reducing automotive VOC, nitrogen oxide, and particulate matter air

emissions. In addition, the ARB has not considered the inability to use low-vapor pressure (LVP) ingredients to reformulate these products and the negative impacts of oily residues in air intake systems that can collect soils from the air. The ARB has also failed to consider current limitations to carburetor or fuel-injection air intake cleaner formulations due to the U.S. EPA's required registration of fuel additives. Finally, Florida Chemical is seriously concerned that these 10% VOC standards will result in the essential elimination of these product categories and the use of non-regulated solvents, like gasoline, in these applications.

Our industry has already reduced emissions from these products and has offered to make additional reductions. However the current proposed 10% VOC standards are not a reasonable compromise, nor are the proposed limits technologically and commercially feasible.

Therefore we strongly suggest that the ARB withdraw the 10% VOC standards and propose a more reasonable regulatory limit that will protect California's air quality without having such a severe negative impact on these vitally important automotive maintenance products.

Sincerely,

Richard Pearl
Regulatory Affairs

October 23, 2006

Clerk of the Board
Air Resources Board
1001 I Street
P.O. Box 2815
Sacramento, California 95812

Subject: Rubber & Vinyl Protectant Definition Change

Dear Clerk of the Board,

Four Star appreciates the opportunity to comment on the current rulemaking. Four Star is a small business in California and a filler of aerosol products. We fill products for the automotive market. Our customers rely on us to formulate effective and efficient products for the consumer's use.

The proposed change in the Technical Support Document involving the Rubber and Vinyl Protectant will have a substantial impact on our tire coating product. The proposed change will classify our coating product as a protectant. Our coating product will not be effective at the VOC level for protectants. Currently our coating product meets the aerosol coating regulation definition of containing a resin and producing a film. If the proposed definition is not modified our product will be banned.

Furthermore, Four Star was under the understanding that the Rubber and Vinyl Protectant (aerosol) was not to be surveyed until the next survey. However, the Technical support document states that some marketers reported early. Was there a formal notice of this survey? Four Star was unaware of this opportunity. We request that this issue be postponed until the next survey as previously noticed.

Thank you for your time and consideration to this issue.

Sincerely,

Jerry Ulrich
Four Star Chemical
President

Subject: ARB's proposed 10% VOC standards

Comment:

Effective automotive maintenance provides very significant benefits to consumers through improved automotive safety, extending vehicle and part life spans, minimizing automotive air emissions, and lowering energy use.

We are concerned that the ARB's proposed 10% VOC standards for Brake Cleaners, Carburetor or Fuel-Injection Air Intake Cleaners, Engine Degreasers, and General Purpose Degreasers could damage our ability to effectively clean and maintain vehicles

We are also concerned that the ARB has not considered the potential hazards that may be caused by residues on brake parts automotive, or the safety benefits of effective brake maintenance and repair.

We also believe that these new standards could have negative cost impacts to the automotive service industry and consumers due to the additional time required for brake jobs and other maintenance caused by using slower-drying and less effective brake cleaners and other automotive maintenance products. Time is extremely valuable in this profession; and lost time has serious negative impacts on our businesses.

Therefore, we are asking the ARB to reconsider its 10% VOC standards, and finally consider a compromise, so that we are not endangered in our ability to provide cost-effective maintenance to automotive consumer in California.

Thank you for listening to consumer's comments.
Ken H.

Subject: Reduction of VOC limits in car care products

Comment:

To Whom it may concern:

While I appreciate your efforts to reduce the VOC content of consumer and industrial products and protect our environment, the result of your efforts is the rapidly escalating cost of the services and products affected by your limitations. Unless you have a plan in place to manufacture these products within the proposed regulations that will neither diminish their effectiveness nor increase the cost, I suggest you look at alternative ways to protect the environment. The disparity in gasoline prices between California and the rest of the U.S. is a good example of the fact that only limitations are brought to the table, not solutions. The result is the consumer bearing the brunt of these so-called "improvements". Please consider my input when deciding the future of automotive care products, as the rest of our nation will continue using the same products, regardless of what is decided in California.

Subject: 10% VOC proposed standard

Comment:

Effective automotive maintenance provides very significant benefits to automotive enthusiasts and DIY consumers through improved automotive safety, extending vehicle and auto part life spans, and enhancing the appearance of new and vintage vehicles.

We are concerned that the ARB's proposed 10% VOC standards for Brake Cleaners, Carburetor or Fuel-Injection Air Intake Cleaners, Engine Degreasers, and General Purpose Degreasers could prevent or hinder consumers from effectively cleaning and maintaining our vehicles.

We take pride in maintaining our vehicles and are concerned about negative impact that these standards may have on our ability to find products that work for a given project.

We are also concerned that these new requirements could increase the time and cost that is necessary for us to maintain our vehicles.

Further, we are concerned that the ARB did not consider the impact of these standards on vintage vehicles that still have carburetors and require effective products to ensure that they remain operational in the years to come.

We are also concerned that the products that would be mandated by these standards could damage the sensitive components of vintage vehicles, or leave residues on vital vehicle systems.

Due to these concerns we urge the ARB to reconsider its 10% VOC standards, and finally consider a compromise, to avoid the negative cost and performance consequences that could result for automotive enthusiasts and DIY consumers.

Comment:

We feel that the upcoming ARB's proposed VOC standards for cleaners and degreasers would greatly damage our ability to reap the benefits of effective vehicle maintenance. It would also impact costs because of the additional time required for automotive maintenance to compensate for less effective cleaners. We feel that long-term testing be carried out prior to any enforcement of these standards.

Subject: VOC Reduction in Consumer Products-Automotive Cleaners
Comment:

October 27, 2006

Attention: State of California, Air Resources Board (ARB),

Please DO NOT amend the present limits of VOC in consumer products used in the automotive industry, specifically brake cleaners, engine degreasers and general degreaser and carburetor and fuel injection cleaners.

These proposed amendments fail to fully consider the long-term safety aspect related to reformulation. A thorough, controlled study of the efficacy of the proposed reformulations has yet to be completed. The data obtained on the alternative automotive cleaners used in the 2005 IRTA Wolf study primarily employed soy oil/acetone blends, Simple Green and water based blends. The study itself appears to be cursory, incomplete and uncontrolled. For example, how much effort was used in each location, with each cleaner, to exact a degree of cleanliness? How "clean" was "clean" in the cleaning descriptions, which appear to be somewhat subjective? Were there controls for each cleaning situation? Was it a double-blind study? How much residue was left in each "cleaning" compared to solvents in use now? Were cleaners with other VOC-exempt compounds such as PCBTF and Methyl Acetate looked at? If not, then why not? These are also effective non-VOC solvents that were not used with soy oil in the study.

These questions do not appear to be answered in this study. They should be answered prior to any VOC content amendments for automotive consumer products.

To remove effective cleaners for safety-sensitive equipment used on California roadways without fully studying the safety and reliability aspect in an effort to achieve a relatively minor reduction in VOC emissions is unwise, unacceptable to those who presently formulate safe and highly-effective cleaners, and not in the best interests of Californians who depend on the quality products from respected manufacturers like Valvoline and Aervoe Industries, who have already reduced VOCs on these products one before.

More study is clearly needed with a more detailed look into safety, efficacy and a true cost-benefit analysis.

I respectfully ask you to seriously consider these comments and questions related to proposed major changes that ARB would mandate in the VOC content of automotive consumer products. Our vehicle

assets, performance and most of all, our safety are at stake here.

Thank you,

Comment:

Please be sure to review the safety conditions of moving from a non flammable material (Chlorinated)to one that is extremely flammable (Acetone) .This will compromise many of the shops that will have to move from a "safe" solvent blend to a highly flammable blend. As a comparison , you may want to look at the furniture industry that was forced by regulation to make a simimlar move and the fires at their establishments that this caused. Many were put out of business --others probably faced much higher insurance costs.

Re: Unreasonable 10% VOC Standards for Automotive Maintenance Products

Dear Mr. Mallory:

Bridgeview Aerosol, LLC is very concerned about the Air Resources Board's (ARB's) 10 % VOC emission standards for four automotive maintenance product categories in the proposed 2006 Amendments to California's Consumer Products Regulation.

The proposed 10% VOC standard for Brake Cleaners, Carburetor or Fuel-Injection Air Intake Cleaners, Engine Degreasers, and General Purpose Degreasers will destroy our ability to manufacture automotive maintenance products that are used to effectively clean and maintain vehicles.

Bridgeview Aerosol, LLC is a private label aerosol producer that manufactures products in all four of these categories for many customers that market and sell these items in California. The impact of these standards would negatively impact these businesses and their customers, i.e., automotive maintenance personnel, classic automobile enthusiasts, and anyone who owns or operates a motor vehicle in California. Proper vehicle maintenance is

essential to maintaining the safety of automobiles and the proper wear of automotive parts like brakes, carburetors, engines, and other components provides for this safety.

Specifically, Bridgeview Aerosol, LLC is concerned that the ARB has not considered the potential hazards that may be caused by residues on automotive brake parts or other vital automotive parts. We are also concerned that the proposed standards will increase costs to the automotive service industry and to consumers due to the additional time required for brake jobs and other degreasing operations as a result of the additional drying time required during cleaning and increased labor required because of less effective products. Bridgeview Aerosol, LLC is also concerned that the ARB has not considered benefits of effective engine maintenance in reducing automotive VOC, nitrogen oxide, and particulate matter air emissions. In addition, the ARB has not considered the inappropriateness of low-vapor pressure (LVP) ingredients used to reformulate these products and the negative impacts that oily residues present in air intake systems where soils from the air can build up and collect. The ARB has also failed to consider current limitations to carburetor cleaner formulations due to the U.S. EPA's required registration of fuel additives. Finally, Bridgeview Aerosol, LLC is seriously concerned that these 10% VOC standards will result in the elimination of these essential product categories and lead to the use of non-regulated solvents, like gasoline, in these applications. As the effectiveness of the cleaning products declines, end users will seek out other materials that will work for them in these applications.

We have been a member of the CARB Technical Advisory Committee on the IRTA study from its inception and we have continually voiced our concern regarding the infeasibility of the formulations that were regarded as "satisfactory" by IRTA. Our internal investigations of these products have not produced results that we believed would lead to marketable products. We had proposed that a standard methodology be used to evaluate the formulations. We have shown in presentations to staff that the results obtained from that methodology shows that the technical performance requirements were not being met. If the products do not meet performance requirements, then they certainly cannot and will not be commercially viable.

Our industry has reduced emissions from these products many times and has offered to make additional reductions. However the current proposed 10% VOC standards are not a reasonable compromise nor are the proposed limits technologically and commercially feasible. Therefore we strongly suggest that the ARB to withdraw the 10% VOC standards and propose a more reasonable regulatory limit that it will protect California's air quality without having such a severe negative impact on these vitally important automotive maintenance products.

Sincerely,

Edward S. Piszynski

Subject: Cleaners and Degreasers

Comment:

Please do not reduce the effectiveness of cleaners and degreasers. They are already less effective than they were ten years ago and that causes more time to be spent trying to clean parts. Time is money as the saying goes and that all gets passed on to the consumer. What will we do when we can no longer clean parts? I understand about keeping the air clean and that is important to me as well. Keeping cars and trucks tuned and running smoothly so they get good mileage with low emissions as possible is what technicians across the country are trying to do. Even more so here in California. Reducing the effectiveness of cleaners and degreasers even further will limit the the technicians ability to do their work. Please don't cripple our businesses in an attempt to get the chemical companies produce a product that is safe and will actually work.

November 09, 2006

Clerk of the Board
Air Resources Board
1001 I Street
P.O. Box 2815
Sacramento, California 95812

Subject: Electronic Cleaner Definition

Dear Clerk of the Board,

AGC is a \$14 Billion dollar manufacturer of commodity and specialty compounds employing 65,000 people at factories across the United States and abroad. We have been in business for 100 years and have a strong commitment to our employees, our community, and our environment.

One of our specialty compounds is used in the electronic industry and falls within the guidelines of the substances that you are evaluating. We are limiting our comments to the Electronic Cleaner proposed definition change. AGC is in support of this proposed definition change. Furthermore, AGC is requesting that products used in the aviation maintenance and on energized components also be included into the exemption in the definition. These additional uses were uses for the compound HCFC 141b, which has been phased out of production. AGC respectfully requests that these two other uses be incorporated into the definition. We appreciate the opportunity to comment on this important issue.

Thank you for your time and consideration to this issue.

Respectfully,

David Ferguson

Comment:

Permatex is a manufacturer and distributor of specialty automotive maintenance and repair products, including tire care products. While the relationship between this product category's inclusion in the Consumer Products rule and the Aerosol Coatings rule is not totally clear, it has been our understanding that these products would be regulated by the former. Accordingly, we have reformulated these products to meet the 10% limit. Permatex does not believe that we are the only manufacturer that has taken this interpretation.

Subject: Proposed Amendmts for Aerosol Coating Products

Comment:

I am writing in support of the proposed amendments to lower the VOC content in aerosol coatings products. Here is my experience as staff in a CUPA as well as the program manager for the Contra Costa Green Business Program:

1. Many shops are phasing out aerosols completely, finding adequate substitutes (particularly water-based brake cleaning).
2. Industry says this can't be done, the regulation passes, and then industry makes it happen.
3. IRTA, headed up by Katy Wolf, does impeccable research. They are practical, working with shops directly to identify possible, EFFECTIVE alternatives. They have done their homework and have found that the lower VOC alternatives work.

If there are practical, effective alternatives that have already been proven, why wouldn't we go ahead and lower the allowable VOC levels according to staff proposed amendments??? I support the proposed amendments.

Robin Bedell-Waite
Green Business Program Coordinator

Subject: Support for Proposed Amendments

Comment:

November 13, 2006

California Air Resources Board
Headquarters Building
1001 "I" Street
P.O. Box 2815
Sacramento, CA 95812

RE: Support for Proposed Amendments to the Consumer Products
Regulation and the Aerosol Coatings Regulation

Community Action to Fight Asthma (CAFA), a statewide network of asthma coalitions working to reduce environmental triggers of asthma for school aged children, urges the California Air Resources Board to support amendments to the Consumer Products Regulation and the Aerosol Coatings Regulation. These amendments will set forth new Volatile Organic Compound (VOC) limits which will achieve a 10.6 tons per day VOC emission reduction statewide by 2008 and an 11.5 tons per day reduction by 2010. These reductions will result in continued progress in achieving state and federal ambient air quality standards and improving health for California residents.

One of CAFAs priorities is to improve indoor air quality since adults and children, on average, spend 90% of their time during the week indoors. The majority of this time is spent in the home where individuals can be exposed to many uncontrolled environmental triggers, including VOCs, which can cause irritation to the lungs and can lead to asthma, allergies and other health threatening conditions. Children also spend much of their day in school classrooms, which can impose additional exposure to indoor air pollutants. Current reports indicate that one in ten school-age children suffer from asthma symptoms.

Recent studies throughout California found there were high air concentrations of formaldehyde and VOCs in some traditional and portable school classrooms due to various indoor sources and/or poor ventilation. VOCs are respiratory irritants emitted into the air by building and interior finish materials, furnishings, and cleaning and teaching products. These indoor air pollutants can trigger asthma attacks and have an effect on student and staff health, academic achievement, and absenteeism. Identifying these triggers and working to eliminate them can help reduce the frequency and intensity of asthma attacks and provide a healthier

learning environment for students and staff.

Of the many asthma triggers in the environment, air pollution is one of the few that can be influenced by policies and regulations.

The Amendments to the Consumer Products Regulation and the Aerosol Coatings Regulation would achieve VOC emission reductions overall, which would have an impact on improving indoor air quality and reducing asthma triggers. These improvements directly impact the health of many who work to manage their asthma on a daily basis.

Asthma coalitions throughout the state, as part of the CAFA Network, are working to improve both indoor and outdoor air quality. In some communities, for example, coalitions are working to implement and enforce indoor and outdoor air quality asthma policies and programs in schools while others are building awareness of air quality problems through inventive community collaborations and partnerships. Regardless of the particular approach, however, coalitions recognize that they can't fix the air quality problem on their own, and that appropriate regulations must be in place to protect the public's health - particularly the health of children. Amendments to the Consumer Products Regulation and the Aerosol Coatings Regulation will go a long way to providing much needed assistance to working toward a solution.

Thank you for your time and consideration. Please feel free to contact me at 510-302-3316 with any questions or concerns.

Sincerely,

Joel Ervice
Associate Director
Regional Asthma Management and Prevention (RAMP) Initiative
Statewide Coordinator of Community Action to Fight Asthma (CAFA)

November 13, 2006

Clerk of the Board
Air Resources Board
1001 I Street, 23rd Floor
Sacramento, California 95814

Electronic submittal:
<http://www.arb.ca.gov/lispub/comm/bclist.php>

Robert F. Sawyer, Ph.D, Chair
Air Resources Board
1001 I Street
Sacramento, California 95814

Subject: Floor polish or wax VOC limits

Dear Dr. Sawyer:

Staff is proposing a 1% VOC limit for all floor polishes and waxes which represents a major reduction from the current limits of 7% VOC for flexible flooring and 10% VOC for non-resilient flooring. Johnson Diversesey, Inc, is willing to accept the staff proposal for the vast majority of floor polish/wax applications. We however, request that you direct staff to continue to work with us to develop an appropriate mechanism to provide for specialized commercial floor polishes at the 3% VOC level that, in use, will emit no more VOCs than products meeting the 1% staff proposed limit. These very specialized products last at least three times longer between applications than a typical 1% VOC product.

About JohnsonDiversesey, Inc.

JohnsonDiversesey (JD) is a market leader in the floor wax/polish category, representing twenty percent of the market, predominantly in the premiere performance product market. JD is larger than the next eight companies combined in floor polish/wax products. No

other company has the prominence, expertise and knowledge that JD has in this product category and we view ourselves as the cutting edge/quality leader. An enormous amount of research and development goes into creating these products. We are also deeply committed to environmental sustainability as reflected by our corporate heritage and our industry leading Healthy High Performance Cleaning program, participation in the US Green Building Council's green building program, LEED, green product certifications with Green Seal, and many others.

JohnsonDiversey has Worked with Staff on a 3% Subcategory

JD understands and appreciates the challenge faced by the ARB and the need for emission reductions from any and all possible sources. However, we strongly believe that products specifically designed to require burnishing as part of prescribed and required maintenance are deserving of a subcategory within the resilient floor polish/wax category. In communications with ARB Staff, we have defined this category of floor polishes, specifically designed to require burnishing as part of prescribed and required maintenance, as the 'must burnish' products. Burnishing resilient floor polish/wax products is recognized as a common industry practice for these products in order to extend service life between product reapplication. From an emissions perspective, the justification for this 3% VOC subdivision is specifically designed performance characteristics that make "must-burnish" products last at least three times longer between applications when compared to 1% VOC products that do not respond to burnishing.

We have worked extensively with Staff to develop a 3% subcategory for this group of products. JD remains convinced that products, which average about 3% VOC, meet very specific needs in the marketplace for maintaining acceptable appearance, adequate flooring protection, and minimizing business interruption through reduced reapplication requirements while maintaining a safe surface for the public to walk on. These characteristics are especially critical in healthcare, hospitality, retail and government facilities which tend to be "24 hour" in open operation. Application of floor finishes requires multiple coats to be applied with time to dry between coats, disrupting business activity in that area of the facility. The application process is also very labor intensive. Loss of these extended service life "must-burnish" products from the marketplace would have a negative economic impact on these businesses and government facilities through increased labor costs and business interruption.

Once applied, these products only need periodic burnishing with a high speed mechanical buffing machine to repair and restore the existing floor polish appearance. Further, we also believe that in-use emissions from usage of these 'must burnish' 3% VOC products will be no greater and likely less than in-use emissions from 1% VOC products. This is because of the reduced number of applications of product and the reduction in the use of VOC containing chemical strippers used to remove existing finishes before installations.

We also want to note that even with a 3% subcategory, JD will need to reformulate a significant number of products and likely will incur expense of millions of dollars. Without the subcategory, the expense is not expected to be significantly higher.

We believe staff understands industry's assertions that a 3% sub-category has merit and we also believe that staff has worked with us to try to develop the appropriate definitive criteria for such a sub-category. Unfortunately, we have, to date, been unsuccessful in our quest.

Conclusion

Due to our inability to date to identify an enforceable set of defining criteria for the subcategory, and faced with a tight time frame, JD will not oppose the current staff proposal of a 1% VOC limit across the product category. We also commit to investigating with staff all other possible options for compliance including the Innovative Product Exemption and the Alternative Compliance Plan available under current ARB regulation. Finally, we respectfully request that the Board and staff be willing to revisit the creation of a subcategory in the future if an adequate definition can be developed.

JD would again like to acknowledge the willingness of your staff to work with us on this issue. They have granted us every meeting we requested and have been professional through each step of the process. Staff has indicated their continued willingness to work with us on this issue and all the compliance options available. JD has already devoted considerable resources evaluating the feasibility of a 1% VOC limit and the effort required for reformulation of their floor wax/polish products and will continue our focus in this area in light of these regulations.

Sincerely,

Robert J. Israel, Ph.D.
Director, Corporate Product Responsibility

First Name: Bruce
Last Name: Douglass
Email Address: bruce@fastundercar.com
Affiliation: Fast Undercar

Subject: Proposed 10% VOC standard for Brake Cleaners
Comment:

Fast Undercar and its customers are very concerned about the VOC emission standards for four automotive maintenance product categories in the proposed CONS-2 regulation.

The proposed 10% VOC standard for Brake Cleaners, Carburetor or Fuel-Injection Air Intake Cleaners, Engine Degreasers, and General Purpose Degreasers could have a negative impact on consumers from increase costs since less effective products will require more time for routine auto maintenance. We are also concerned that ARB has not fully considered the impact of these standards and has not conducted significant long-term testing to ensure that the resulting products will not endanger vehicle safety or consumer preferences.

We understand that the automotive product industry has already reduced emissions from these products and has offered to make additional reductions. We are asking ARB to reconsider its 10% VOC standards and consider a compromise that will protect California's air quality without having a negative impact on our members' ability to provide quality vehicle maintenance.

Sincerely,
Bruce Douglass, President and CEO

Subject: California Consumer Products Regulation

Comment:

Request for CARB action.

Southern California Edison Company is concerned that your current Consumer Product Regulation is severely limiting, or denying, our ability to provide safe electrical service to our customers. Our workers must use clean non-conducting tools to work on energized and non-energized (at that time) electrical equipment. The tools and electrical equipment need to be clean, dry, and without residue after the cleaning process. There is a real need for limited use of denatured alcohol. Since you have opened the Consumer Product Regulation, we believe this is the time for regulatory relief.

Denatured alcohol, at this time, is the only solvent we have available for use in cleaning electrical equipment and the cleaning of tools etc. used in the repair and maintenance of our electrical equipment. SCE can use the product we have on hand, in aerosol format, for a limited use through period according to Title 17. We request an exemption be put into the CARB regulations similar to the one in SCAQMD Rule 1171. The CARB restriction on the use of solvents less than 45% VOC by weight for Electrical Cleaning in Title 17 is detrimental and unsafe for our employees. The exemption that is requested would be based on SCAQMD Rule 1171 (h) (4):

We suggest it should read:

"Cleaning with aerosol products shall not be subject to the 45% VOC by weight restriction if 160 fluid ounces or less of non-compliant aerosol products are used per day, per facility."

Denatured alcohol is needed for the cleaning of our electrical apparatus because it does not damage electrical component insulation systems, it displaces/eliminates and does not add moisture which can cause the insulation systems to fail, and it does not leave a residue which can cause high voltage electrical tracking which leads to equipment failure. We do not have a substitute clean up with these features.

Continuity of electricity supply, and minimization of electric equipment failure, is too critical to the economy of California, compared to the marginal air quality benefit to be obtained from elimination of the VOCs from denatured alcohol used in critical cleaning of the utility infrastructure.

At this time there is a serious conflict between the definitions

of VOC, the regulations, and exemptions between CARB and the local air districts. Most of our concern is in the SCAQMD, although we operate in nine districts across the state. We also are having trouble with manufacturers of VOC solvent and coating compounds in getting them to design and provide usable compliant product. California utilities make up a small share of the market and we do not have leverage to force research and production of the coatings and solvents needed peculiar to our industry.

We therefore request that CARB include in your VOC definition all of the "exempt compounds" found in the SCAQMD Rule 102 VOC definition? This would hopefully allow manufacturers to produce more low VOC compliant "green" chemical products for the California market without the current conflicting regulations at the state/local levels.

Please contact me if you desire additional information.
