California Air Resources Board members
1001 I Street
Sacramento, CA 95814

Dear Air Resources Board members,

I urge you to uphold and protect California's low carbon fuel standard, which is reducing our state's oil dependency, lowering the global warming pollution caused by oil, and ensuring that oil companies are investing in cleaner alternatives.

Nearly a year ago, California voters rejected attempts by oil companies to undermine our state's clean energy law by soundly defeating Proposition 23. Now oil companies are attempting to weaken the low carbon fuel standard, a core part of the law, by weakening requirements and exempting dirty, high-carbon fuels. The board should reject these attempts.

Oil companies have the ability to invest in cleaner solutions, and the standard ensures they do so. By reaffirming your strong support for the standard, you will send a strong signal that California is serious about moving from being one of the biggest importers of oil to a leading exporter of clean energy. California can lead the world in investing in cleaner and safer sources of fuels. Hundreds of companies today are involved in helping fuel our cars and trucks from alternatives such as electricity, hydrogen, advanced biofuels and natural gas.

The board should also vote to ensure that oil companies are not only phasing in cleaner fuels, but phasing out the dirtier ones. I urge you to direct Air Resources Board staff to strengthen their proposal by

ensuring that each oil refinery properly accounts for its use of dirtier oil sources -- like tar sands -- that only take us backwards.

California must move forward and help grow the clean fuels industry with this standard. Again, please vote to strengthen California's leadership in clean fuels and to reject attempts by oil companies to undermine our low carbon fuel standard.

Sincerely,

Ms. Laura Lynch
167 Hancock St
Meriden, CT 06451-3805

Subject: California clean air and dirty oils (tar sands)
Comment:

I am a native born California as were my parents. My grandparents moved to California in the early 1900's. They were contributing citizens who helped build the marvellous state of California.

Though I no longer live in California, I have relatives still in the state and visit frequently; therefore, I follow California politics and activities.

I am very proud of California's government leadership and visionary position taken with regards to clean air and improved car fuel efficiency/reduction of GHG emissions.

For the last 20 years I have lived in Calgary, and now on Vancouver Is. were resource extraction occurs in our backyard...it is enormously distressing.

California needs to strengthen its light truck, car GHG emissions and clean air policies. Why? Because countries like Canada have very weak governments who swoon to big oil, gas and coal interests.

The only way to save our environment and the native americans who are dying (due to tar sands extraction) is to cut back on the demand side for our resources. That is the role California plays. California with strong legislative rules for GHG mitigation, by its action, will show the way for other gas consuming governments how they too can legislate positive polices to bring about a transition to alternative energy.

Please help us up here in Canada to save our environment.

Don't forget, the tar sands extraction in Northern Alberta is the largest open pit mind on the plant, with little government oversight and devastating consequences to our environment and slow death to the small populations of Native Americans living downstream from the tar sands extraction.

Thank you

Jeanne Keith-Ferris
Vancouver, Island

Subject: Support of LCFS regulation

Comment:

Our dependence on hydrocarbon fuels is unsustainable for many reasons:

- 1) Burning them causes atmospheric carbon to increase which results in climate change, which will result in shifting concentrations of drought, more intense Atlantic hurricanes, threats to existing food supply chains, unknowable damage to biodiversity and more.
- 2) Known reserves of fossil fuels, while still vast, are getting harder and more expensive to extract. Spending money on coming up with new ways to extract these hydrocarbons is a bad decision not only for our planet but also for our wallets. Money is much better spent on developing technology to improve the harnessing of renewable energy.
- 3) If dependence remains high, the location of new fossil fuel reserves can cause contentious relations among nations and can even lead to (more) wars.
- 4) The location of known reserves such as Alaska are home to precious wildlife and nature preserves and drilling will damage these pristine habitats.
- 5) The rise of developing nations such as China, India and Brazil is happening largely with coal and through vast deforestation. This will accelerate the already expected global warming trajectory and soon we will find that we have spent too much time trying to win support for further extraction of fossil fuels and not enough on a backup plan.

For these reasons and more it is vital that California be brave in leading the way toward a more sustainable future. Do not back down to Big Oil, instead you should get each oil company to commit to developing renewable energy laboratories. At the very least you should impose an abatement program for the emissions they are responsible for in the state. The answer is in front of us. Let this not be another example of how being presented with the solution too early can lead to inaction. We have learned our lesson and it is time to act now. This can be done and CA will set the tone for the rest of the nation.

Subject: Form Letter # 2
Comment:

Dec 5, 2011

Chairman Nichols
1001 I Street
Sacramento, CA 95812

Dear Nichols,

I support the California Air Resources Board's leadership in bringing about landmark laws and policies to fight climate change and protect public health. The Low Carbon Fuel Standard is a critical piece of California's AB 32 program and I urge you to reject the oil industry's efforts to weaken the standard.

The Low Carbon Fuel Standard must properly account for dirtier, higher carbon fuels and CARB must stay the course in implementing this critical clean air program on schedule. I urge CARB to support a strong LCFS that fully accounts for all the air quality and environmental impacts of petroleum fuels and does not give a "pass" to dirtier fuels.

I join with the American Lung Association in California in urging you to ensure that California's fuels become cleaner over the next decade to support clean air, public health and spur investment in alternatives to dirty oil.

Sincerely,

Mr. Mark Weinberger
391 28th Ave
San Francisco, CA 94121-1867

Subject: LCFS Regulation
Comment:

To Whom It May Concern:

Given that we aren't even sure that there will be sufficient blending stocks to comply with this measure, why are we moving forward? Would it hurt to do more research on how this regulation could actually be successful before pushing an extremely costly burden on an economically crippled region? Fuel prices account for a larger portion of our budgets than they ever have, yet we are thinking of ways to increase them further during the largest recession we've seen in our generation. We all want clean air and we all want to find ways to become more independent in our fuel supply. Please reconsider more attainable and achievable goals for this regulation.

Respectfully,
Clark Nakamura

Subject: Low Carbon Fuel Standard Regulations

Comment:

It would be a bad idea to weaken the Low Carbon Fuel Standard Regulations. Yes, it will cost money to implement them; however, it will take employees to do it. Carbon Dioxide and other hydrocarbons in the atmosphere are a significant source of climate change. We, in the US, are not stepping up to our responsibilities to help slow the global rate of carbon emissions. At the least California should not back off from what is an acceptable step in the right direction.

Subject: Low Carbon Fuel standard addresses massive market failure

Comment:

Our auto fueling infrastructure exists in the context of a massive market failure. There's a tiny tax on gasoline, totally inadequate to the task of paying for the health effects of auto pollution, and minimizing the existential threat to our climate from global warming due to human creation of greenhouse gases.

I urge you to stand firm on requirements in our Low Carbon Fuel standard.

Comment:

Without being a "treehugger", common sense and the realization that my family as well as I are DEEPLY affected by the largely self-serving, INDUSTRY DRIVEN AND INDUSTRIAL FINANCIALLY supported votes being cast, represent a "1 STEP FORWARD AND 10 STEP BACKWARD" solution to a world-wide problem.

Constantly running for re-election, I can only surmise, that their "involvement" eventually results in "personal" gain for these individuals, who's singular real goals are driven by their desire to keep feeding from the public "trough" as long as possible.

With some exceptions, most of these "leaders" arrive, after being elected, at their "posts" with limited funds and otherwise mostly average future expectations. These expectations "miraculously" allow them to rise in income and with benefits few would attain, had they pursued career paths like the "Real Taxpayers" do, of whose, ever increasing taxes in various forms, they live.

PLEASE MAKE AN EFFORT TO ACT IN THE INTERESTS OF THE PUBLIC AND THOSE OF THE DECEDENTS OF TODAYS VOTERS.

Comment:

I live in Benicia. The San Francisco Bay Area is experiencing the fourth "spare the air day" in a row. Some of the blame is due to wood burning fireplace, but the main culprit is still the pollutions from cars and trucks. How can you seriously think that allowing higher polluting fuel will not make this situation worse? Please continue your policies of encouraging and enforcing low pollution fuels so that we all have a chance to have air we can breathe.

Thank you, Diane C. Reeve

Subject: Clean fuel laws
Comment:

I am a native Californian born with severe asthma. When I was a child growing up the air quality in some places like LA, San Fernando Valley and San Bernardino was horrendous. Frequently my eyes burned and my need for medication went up. Thank God some people wised up and passed some clean fuel requirements, enabling the smog to go down at least somewhat since the 1970s.

The selfishness and small-mindedness of the oil and coal industries who, recognising that these resources are finite and who now want freedom to engage in any form of high-pollution production and/or composition of fuel, or any relaxation of air quality regulations. There are many people like myself, born with asthma and other severe respiratory allergies--for whom smog represents a consignment to early death. Just because we were born with this handicap does not make us 2nd class citizens, forced to give up part of our lives to let the industries fill their bank accounts.

The oil and coal industries need to move forward, not backward. It is past time for American ingenuity to come up with something better than tar sands mining, fracking and other energy sources fraught with more extreme pollution. It's time to get engineers and scientists on the job designing the energy sources of the 21st Century--fund these efforts with the money now used to subsidise old dirty technologies. And don't cave into the old industry hacks who want to prolong the 20th Century thinking.

Sincerely,
Ellen McRae

Comment:

We drive a Chevy Volt, and absolutely love it. In over 10,000 miles so far, we have averaged 136 miles per gallon. It is a roomy, well-equipped, extremely safe and responsive vehicle, and we use it almost exclusively. As a medical professional, my wife needs extremely reliable transportation, and this is it.

When we can, we hope to buy an all-electric as well, to replace our second car (which is now rarely used).

There is major pent-up demand for new cars, as people have been unable to afford them during the recession.

Please do everything you possibly can to support the continued leadership of California in bring electric vehicles and plug-in hybrids (Extendd range electric vehicles) to market at scale.

Subject: Clean Energy
Comment:

My husband and I have lived in the lower Sierras in California for over 30 years, and during this time we have run our entire home on solar energy. Back in "those" days, not a lot of information was available on solar energy, but through books and articles we taught ourselves how to set up an installation of panels. I might add, this was done on a very limited budget, and as money was available, we added and updated our setup. When power outages occur in this area, it has no effect on us and our neighbors who have followed suit. Needless to say, we have had reliable energy, minus no interruptions and no utility bills. And, no negative impact on the environment. Goooo solar!!

Subject: Air quality

Comment:

I suspect we all know that in 1949 General Motors was convicted of "a conspiracy to destroy the mass transit system of the United States." We also know they received a slap on the wrist and then did it with the collusion of many companies dealing in expendables, chief among the expendables being petro.

In essence, when an elder or person with a compromised respiratory system must stay inside or actually dies from pollution - and it happens - we can lay these deaths and loss of freedoms at the feet of a corporation which had become sociopathic. One which placed the monetary interests of it's officers and shareholders above the public good, and public health. This is literally psychotic, and this same mindset is trying to convince you that somehow the exacerbation of these problems is in your best interest.

The actual truth is somewhat contrary to that. Even if they bribe you and lobby you for these adverse impacts on public health, you still will be forced to breathe the bad air. You will have more unhealthy toxins flood the environment and settling into your water and food supplies. Your children and grandchildren will be adversely impacted. Why? So that a few other people make even more money than they already do as they rake in record profits in hard economic times.

Don't you question why they see a huge need for increased pollution when they personally are quite comfortable? It would seem that if they are having corporate difficulty they could take the billions of dollars in shareholder payouts, executive bonuses and salaries, and reinvest these monies in improved technologies and processes. Maybe even build a new refinery for the first time in over 30 years in the US. Wow, crazy!

Comment:

Dear California Air Resources Board Members:

I urge you to uphold and protect California's low carbon fuel standard. The standard protects the health of Californians, helps cure us of our dangerous addiction to oil, and creates jobs producing cleaner fuels to help meet our long-term climate goals.

By reaffirming your strong support for the standard, you will send a strong signal that California is serious about moving from being one of the biggest importers of oil to a leading exporter of clean energy. The board should also vote to ensure that oil companies are not only phasing in cleaner fuels, but phasing out the dirtier ones. I urge you to direct Air Resources Board staff to strengthen their proposal by ensuring that each oil refinery properly accounts for its use of dirtier oil sources -- like tar sands -- that only take us backwards.

Please vote to strengthen California's leadership in clean energy and reject attempts by oil companies to undermine our low carbon fuel standard.

Comment:

Greetings,

Many of us live in areas where there is a blanket of smog during much of the year. I just paid \$1,000 for two bicycles so my wife and I can pollute less - so please continue the fight for cleaner air and resist changing these standards. Going backwards is not an option as would make San Joaquin Valley air even more filthy.

Thanks,

Doug Morris

Please do not weaken this law. I would like you to know that I recently bought a diesel - which cost half of what I make each year. I am so frustrated with the lack of action and care from gas/oil companies, and I want to do my part. Please don't let them whine that the public won't pay for carbon reduction. We, the 99%, will be the ones who suffer when there is no air/water. The 1% will always have the money to visit the moon, patagonia in a helicopter, etc. Back here on earth, we want change, and we are willing to both sacrifice and speak out, and VOTE to get it. This law has been passed. Please do not weaken the standards we must have to keep a liveable earth.

I support a pipeline from Canada. I support our having enough of our own gasoline, propane, and fossil fuels to provide all our own fuels and not be beholden to Saudi Arabia and other oil producing countries. Going totally to "clean" fuels is now and will be too expensive to be economically sound policy. I do not support forcing any company to spend for additional cleaner burning fuel. I do not support adding to California's current carbon fuel standards. They are difficult enough to adhere to already.

Mandated California gasoline has fewer miles per gallon than gasoline provided in other states. Lower mileage makes for foolish economics.

Don't increase restrictions on gasoline. Don't make steeper and more restrictive carbon fuel standards the norm in California.

Subject: We Must Take Steps Reduce Greenhouse Gas Emissions Now

Comment:

To Whom It May Concern:

The world-wide "greenhouse effect" caused by man's emission of CO₂, CH₄ and other well known "greenhouse gases" is of immediate and vital concern to national security, public health and ultimately, survival of our civilization. This story is well known in all its details and time scales, and scientifically validated. This is not a linear problem: once we cross some thresholds, they take millennia to be "re-crossed."

We in CA must very significantly reduce our emission of greenhouse gases in the near and far terms, and one near-term way is to reduce/prohibit the use of "high carbon fuels" such as coal, heavy oil fractions, tar sands and other "reduced" forms of fossil fuels as sources of energy throughout, including in "power generating plants." To accomplish that, we need a strong reduction in the use of fossil fuels, and, of course, we need to support the development and evolution of non-fossil sources of energy at the scales needed to support the public's needs. These "green" power sources include solar, bird-safe wind, tidal and nuclear power, and advanced batteries for mobile applications.

If we don't take the lead in reduction and ultimate elimination of the use of fossil fuels, the cost of replacing our great coastal cities, inland agricultural, forestry and animal food production areas (note that most of the farming areas are within a few feet of sea level), changing our very expectations from all conventional sources of food from the land and the sea (already in danger from acidification from increased CO₂ burden), and protecting ourselves and our plant and animal life from tropical diseases and others will far far exceed the immediate costs of moving from a fossil fuel economy to a "renewable" power economy. Please do not bow down to the lobbying of the rich and powerful fossil fuel economy: they will take their profits and invest in survival homes in Switzerland and other mountainous areas, leaving us to drown, die of hunger or disease. Seems extreme? Not if we ignore this problem and follow the lead of the spokesmen of the fossil fuel companies.

California has done so much to clean up our air since I was a child and the smog burned my skin, eyes, and lungs, especially during the summer when I wanted to play. We still see the smog when we return into the valley from the north. It lays like a layer of soot over us.

I know you have taken a lot of heat from the business community, who are also vital to our survival. However, without clean air to breathe, we would all die--although our pockets may be full of worthless dollars--because without clean air, there would be no life.

Please hold the line. California is a gift to the people. Please don't dirty it, not just for me, but for future generations.

Comment:

Oil companies and their well-funded lobbyists are hard at work in Sacramento to undermine California's "low carbon fuel standard," which requires oil companies to invest in alternative energy sources. It also prevents some of the dirtiest fossil fuel sources—such as tar sands—from being used in California.

I support your plans to propose changes. Please ensure that companies use cleaner, low carbon fuel.

Comment:

We support the Low Carbon Fuel Standard. This standard will provide an economic stimulus for economic growth in California. Why because rather than paying \$4 a gallon for fuel residents will be able refuel their Lithium battery cars at a cost of 25¢ a gallon equivalent saving about \$2,000 a year of fuel costs by going Renewables as opposed to gasoline. New financing is available through Residential lease financing offering Zero Down systems and through Housing and Urban Development Administration to make the cost of acquiring distributed energy affordable and economic as opposed to maintaining the status quo.

Subject: Natural Gas GREET LCFS Emissions Should Be Increased Now

Comment:

Howdy CARB,

Cc: "Harvey Eder" <harveyederpspc@yahoo.com>Message contains attachments4 Files (2467KB) | Download
AllEmissionsCNG&DieselBuses.pdfShindell-Methane34&105.pdfGHG footprint of natural gas from shale formations.pdfLandfill-gas-to-energyIncreasesGHG-Jul11.pdfCorrect the LCFS GREET to account for fugitive natural gas emissions

The GREET standards used for the LCFS do not correctly account for fugitive natural gas emissions and other GHG emissions.

1. CARB still uses a methane carbon intensity of 25 times CO₂, instead of the latest science saying it is 34 over 100 years or 105 over the next crucial 20 years, as shown in the paper by Drew T. Shindell, et al., "Improved Attribution of Climate Forcing to Emissions," Science 326, 716 (2009). (attached) When will CARB use the latest science?

2. The latest science says that methane produced by fracking has more fugitive emissions than conventional natural gas, which should be included in any LCFS for methane produced by fracking. The paper by Howarth, et al., says fracking "methane emissions are at least 30% more than and perhaps more than twice as great as those from conventional gas..) See attached paper, "Methane and the greenhouse-gas footprint of natural gas from shale formations," Climatic Change (2011) 106:679-690, downloadable from: DOI 10.1007/s10584-011-0061-5

3. GHG emissions from aged natural gas engines are considerably more than new engines, and should be included in the calculations. The paper by Melendez, et al., indicates in Fig. 14 on p. 22 that older natural gas engines could emit as much as 50% more emissions than new buses. See attached paper, "Emission Testing of Washington Metropolitan Area Transit Authority (WMATA) Natural Gas and Diesel Transit Buses," downloadable from:
<http://www.afdc.energy.gov/afdc/pdfs/36355.pdf>

4. CARB has failed to account for even the EPA acknowledged 75% fugitive emissions related to methane from landfills (and it is probably more than 75% over the full life of a landfill), as compared to methane from contained anaerobic digesters of waste with 0 % fugitive emissions. See attached paper by Jim R. Stewart, "Landfill Gas-to-Energy Projects May Release More Greenhouse Gases Than Flaring,"

Welcome Inbox New Folders Mail Options

Attached is information that has been submitted to CARB staff over the past several months and several years for GHG LCFS from natural gas that needs to be addressed now in this review.

More data will be submitted.

This is off by orders of magnitude when combined and at the very least by several factors. Example, in CARB February 27, 2009 GREET for CNG a "placeholder" figure of 0.0375 grams methane per mile is used for natural gas emissions while the CARB papers sent for review of this issue on Washington D.C cng buses sent by Michael Benjamin & via via Cody Livingston documents from 10 to 17+ grams CH₄ emitted per mile. More recently the April 2010 study of natural gas GHG methane emissions provided by SCAQMD has data of from 40 to 100 grams methane/CH₄ per mile emitted for heavy duty vehicles. Suspiciously the same number was used for nitrous oxide N₂O of 0.0375 grams emitted per mile. This is off by over 100 to 1000 times the number used by CARB staff and nothing was done about it when brought up to staff on the record or by the Expert Work Group (several times). This will all be documented in detail in future litigation following CARB's Board's decision not addressing these issues.

Thanks, take care

Harvey Eder/ Public Solar Power Coalition

PS Natural Gas is the main competition for solar electric and solar hydrogen and our resources are limited and increasingly scarce.

Comment 63 for Amendments to the Low Carbon Fuel Standard (lcfs2011) - 45 Day.

First Name: David
Last Name: Atwater
Email Address: gm@vandepol.us
Affiliation: Business Person

Subject: LCFS

Comment:

I wish someone in government was actually here to help businesses survive instead of trying to, yet again, KILL CALIFORNIA. This theoretical plan is just that an unfeasible attempt to create draconian short term solutions to long term issues without listening OR RESPONDING, in any meaningful way, to the true stakeholders in the State. I am talking about businesses. We pay most of the taxes, provide all the services, feed and clothe every Californian. CARB does NONE OF THIS!

If there is going to be a plan it must be a REAL SOLUTION. Not a one sided attempt to "get those baaad polluters." CARB has showed no creativity, but expects an endless supply of patience and money from the businesses that make this State function.

Our Government is broke, businesses are struggling and/or leaving the state and yet we are continually force fed pipe dream regulation by an omnipotent organization that cares not for the regulated community, but only for the interests of this unionized bureaucracy and its continued growth.

Get real, use real science, and real technology, be practical and quit making up statistics to get what you want. The old saying in business is figures don't lie, but liars sure can figure.

Time for real long term solutions, not a parade of political gamesmanship.

Subject: Suspension of Low Carbon Fuel Standard (LCFS)
Comment:

Silvas Oil Company is a Petroleum Marketer of fuels within Fresno,CA, Bakersfield,CA, Kingsburg,CA, Oxnard,CA and Santa Maria, CA. We respectfully requests that you immediately suspend the Low Carbon Fuel Standard (LCFS). This regulatory package could have the most significant impact on California fuel costs than ANY previous legislative/regulatory program has ever had. We are of the opinion that more information needs to be gathered before this standard is implemented.

Sincerely,

John Browning
Special Projects Manager

Comment:

The responsible analysis of LCFS regulations has NOT been done.
The cost is too high for what could be zero improvements.
This regulation plays with tens of millions of lives. It should not be implemented on a hope and prayer.
Under all circumstances the following guarantee should be included in all regulations.

If this provision does not achieve the following empirical data by this year and month then the regulation will be null and void and the government will be responsible for reimbursing all citizens the LCFS related costs to their person.

Thank you for your time

Subject: stop tar-sands oil
Comment:

To the Members of the California Air Resources Board:

I urge you to uphold and protect California's low-carbon fuel standard to reduce our dependence on dirty energy and fight global warming. I ask you to reject any rule changes that would weaken the standard.

The oil industry's attempt to exempt dirty, high-carbon fuels such as oil mined from Canadian tar sands is unacceptable. As currently crafted, the fuel standard is intended to encourage oil companies to invest in cleaner fuel solutions, reducing greenhouse gas pollution in California. The changes proposed by the oil industry would undermine these intentions.

The standard must ensure that oil companies are not only ramping up cleaner fuels but phasing out dirtier ones. The rule should be strengthened to require each oil refinery to properly account for its reliance on dirtier oil sources. By no means should the low-carbon fuel standard be weakened to accommodate the use of dirty and highly energy-intensive fuels like tar-sands oil.

Please vote to strengthen California's leadership on clean fuels and reject oil-company efforts to undermine the low-carbon fuel standard.

Thank you.

Comment:

Developing and facilitating the EV market is an important aspect of achieving CARB's greenhouse gas reduction goals. Using the value of LCFS credits to encourage the development of the market by benefiting PEV consumers is a major component of satisfying this goal. SDG&E concurs with statements by CARB staff in various LCFS workshops that it's paramount that the value of LCFS credits should be given to those who invest in EVs, as well as those who help to transform the market for electricity as a transportation fuel.

Comment 76 for Amendments to the Low Carbon Fuel Standard (lcfs2011) - 45 Day.

First Name: Amy
Last Name: Ehlers
Email Address: ayeh@novozymes.com
Affiliation: Novozymes

Subject: Novozymes written statement to CARB - LCFS
Comment:

Novozymes written statement to California Air Resources Board
Public Hearing to Consider Amendments to the Low Carbon Fuel
Standard Regulation
December 16, 2011

On behalf of Novozymes and its 829 employees across America - from California to North Carolina - we thank you for the opportunity to submit this statement for the record.

We appreciate the dedication of the California Air Resources Board (ARB) and its staff to creating a low carbon future and incentivizing technologies which can realize that low carbon fuel standard (LCFS) future. We share that commitment.

Today, we would like to highlight ARBs open working process and facilitation with regulated parties, supplier industries and other stakeholders. We believe this process has already enhanced the LCFS and should serve as a model for other carbon-limiting legislative and regulatory efforts.

Novozymes
Novozymes is a technology and science company; we respect and encourage both. We have more than 5,000 patents and 700 products at work in 130 countries: enzymes that remove trans-fats in food, lower the temperature needed to wash a consumer's clothes - and convert biomass, from switch grass or corn stover, into biofuels. Our technology saves consumers money and protects the environment for our children. California continues to lead the nation in environmental stewardship and, at our research facility in Davis, we are proud to continue that stewardship with cutting-edge research.

Like ARB, we imagine a world where everyday products are made with organic materials instead of oil, creating a lower carbon society:

- Transportation fuels made from agricultural and forestry waste and non-food energy crops, with greenhouse gas emission reductions up to 90 percent of their fossil fuel counter parts
- Detergents that clean thoroughly in cold water, reducing energy consumption, consumer spending and water pollution
- Plastics and polymers based on renewable biomass - not petroleum
- Renewable chemicals that are less harsh to the environment
- Food crops that require less fertilizer and water, yet produce higher per-acre yields

- Animal feed that promotes greater nutrient absorption, and reduce harmful by-products in animal waste

Technology Readiness

Biofuels are the only currently available option which notably limits CO2 emissions in transport in commercial quantities. That gives them a central role in the world's future, sustainable energy mix.

The industry is constantly improving technologies and processes, delivering increasingly green and sustainable energy. But as an indication of the technology readiness of the domestic advanced biofuels industry, Novozymes is nearing completion of a state-of-the-art enzyme manufacturing plant in the Midwest, a \$200 million investment in America's future. Our Blair, Nebraska enzyme facility has already created 140 construction jobs and will bring 100 permanent jobs when it opens in 2012. In fact, 45 full-time employees are already at work. These are good-paying, sustainable jobs for families creating sustainable energy for our country. Advanced biofuels projects can replicate this type of local economic development all over America, including California.

We believe private industry drives America's economy. However, we also believe a strong partnership is vital to the success of any emerging industry, where the private sector provides the innovation and lion's share of capital to develop it - and the public sector provides consistent policy support to grow it. This is just one reason why we are heavily invested in the creation, administration and adoption of the California LCFS.

Sustainability

Novozymes is committed to sustainable business and recognizes the importance of sustainable development for society to meet future needs while minimizing impacts on our environment. Sustainability is rooted in our company values and expressed in our ambition to "drive the world toward sustainability with our customers." Measurement and innovation are key aspects of success. We conduct Life Cycle Assessments on our products to understand their environmental impact and use that understanding to create solutions that help our customers improve the environmental performance of their products and processes. Taking a life cycle perspective also helps us understand global sustainability trends in climate change, pollution and water consumption. We continue to be a science-based voice that advocates for improvement in these and other issues that face our world.

Novozymes also continues to reduce our own environmental footprint.

We have set ambitious goals of increasing our energy efficiency by 50 percent and water use efficiency by 40 percent over our 2005 baseline by 2015. These and other sustainability strategies have garnered numerous third-party recognitions including Gold Class status in the Dow Jones Sustainability Index.

GHG emission reduction for cellulosic biofuels are not yet based on large scale production, but the GHG emission reductions are repeatedly estimated to be between 80 and 110 percent. These results seem to be rather robust, particularly for crop residues. This is because there are no or low indirect land use change impacts and because the lignin co-product ensures that both biofuels and power are produced.

Advanced Biofuels: Many Benefits

We believe the review report from ARB staff should focus on the administration of the LCFS. Nevertheless, we also believe we must address world hunger, and we have continually acted on that belief.

Recently Novozymes made a commitment at the Clinton Global Initiative where, together with environmental venture group CleanStar Ventures, we established an integrated food-energy business in Mozambique, which is one of the countries pointed out in the new report from FAO on food insecurity.

The project will create incentives for rural Mozambicans to plant and maintain trees and grow crops, including cassava -- a starchy root -- for biofuels. It will also replace thousands of charcoal-burning cookstoves with cleaner ethanol stoves. Agriculture in the developing world holds an enormous potential. Through this partnership, local communities in Africa will be able to produce more food and energy while at the same time improving their health, restoring forests, cleaning the air, and growing the economy. We work with smallholder farmers to implement sustainable farming practices, create a food and ethanol cooking fuel production facility, and lay the groundwork for economically and ecologically sustainable communities in Sub-Saharan Africa.

Just last month, Bank of America Merrill Lynch signed an agreement to generate carbon credits for every metric ton of carbon dioxide that is avoided from displacing charcoal used in cookstoves. The upfront carbon finance obtained from voluntary carbon markets will go to purchase and maintain cookstoves.

Despite uncertainty in alternative energy policy, and an oil and gas industry that is able to count on long term favorable incentives and policies, the biofuels industry has accomplished significant advancements and innovations. If we have been able to achieve so much in so short a time with these uncertainties, imagine what we could do with more stability.

The technology is here and with continued public support, we can continue to provide viable, innovative solutions.

We thank ARB and its staff for its diligent work establishing and administering the LCFS. We look forward to working with CARB as California's LCFS continues to be evaluated and implemented and continue to be available as a resource as you move forward.

Subject: Correct the LCFS GREET to account for fugitive natural gas emissions
Comment:

Correct the LCFS GREET to account for fugitive natural gas emissions

The GREET standards used for the LCFS do not correctly account for fugitive natural gas emissions and other GHG emissions.

1. CARB still uses a methane carbon intensity of 25 times CO₂, instead of the latest science saying it is 34 over 100 years or 105 over the next crucial 20 years, as shown in the paper by Drew T. Shindell, et al., "Improved Attribution of Climate Forcing to Emissions," Science 326, 716 (2009). (attached) When will CARB use the latest science?

2. The latest science says that methane produced by fracking has more fugitive emissions than conventional natural gas, which should be included in any LCFS for methane produced by fracking. The paper by Howarth, et al., says fracking "methane emissions are at least 30% more than and perhaps more than twice as great as those from conventional gas..) See attached paper, "Methane and the greenhouse-gas footprint of natural gas from shale formations," Climatic Change (2011) 106:679-690, downloadable from: DOI 10.1007/s10584-011-0061-5

3. GHG emissions from aged natural gas engines are considerably more than new engines, and should be included in the calculations. The paper by Melendez, et al., indicates in Fig. 14 on p. 22 that older natural gas engines could emit as much as 50% more emissions than new buses. See attached paper, "Emission Testing of Washington Metropolitan Area Transit Authority (WMATA) Natural Gas and Diesel Transit Buses," downloadable from:
<http://www.afdc.energy.gov/afdc/pdfs/36355.pdf>

4. CARB has failed to account for even the EPA acknowledged 75% fugitive emissions related to methane from landfills (and it is probably more than 75% over the full life of a landfill), as compared to methane from contained anaerobic digesters of waste with 0 % fugitive emissions. See attached paper by Jim R. Stewart, "Landfill Gas-to-Energy Projects May Release More Greenhouse Gases Than Flaring,"

Subject: Clean Energy supports ARB staff's proposed LCFS Amendments
Comment:

December 15, 2011

Mary D. Nichols, Chair
Members of the Governing Board
California Air Resources Board
1001 "I" Street
P.O. Box 2815
Sacramento, CA 95812

RE: Clean Energy strongly supports the proposed Amendments to the Low Carbon Fuel Standard Regulation as presented by staff.

Dear Chairman Nichols and Members of the Air Resources Board,

Clean Energy is in strong support of the proposed amendments to the Low Carbon Fuel Standard (LCFS) Regulation before the Governing Board. It is our belief that staff has carefully reviewed the program's progress through this initial year and has determined that not only is the program solvent for compliance purposes, but that low carbon fuel production is continuing to ramp up to meet the needs of regulated parties to achieve the standard's 2020 low carbon fuel reduction goal of 10 percent.

Clean Energy staff has worked very closely with Air Resources Board (ARB) staff over the past few years to address a number of the Natural Gas Vehicle Industry's concerns pertaining to the initial rulemaking. These concerns dealt with the original Energy Efficiency Ratio applied to medium- and heavy-duty natural gas vehicles, fuel quality concerns for mobile applications for territories covered by Southern California Gas Company and San Diego Gas & Electric utilities, and the ability for renewable natural gas fuel providers to deliver this ultra low carbon product to the California market in an efficient and enforceable manner. Further, Clean Energy was an active participant of the LCFS Advisory Committee and would like to commend the leadership of Mr. Richard Corey and his staff for professionally addressing many stakeholders concerns by providing reasonable and well thought out solutions that make the LCFS regulation functional.

Clean Energy was proud to make up nearly nine percent of the LCFS credit market for the first quarter of 2011. As we start to deploy our American Natural Gas Highway in 2012 and ramp up our production of renewable natural gas (also known as biomethane) through our

subsidiary, Clean Energy Renewable Fuels, we hope to demonstrate to this agency that natural gas, conventional and renewable, can and will provide a meaningful low carbon fuel solution to the transportation sector for decades to come. Thank you.

Sincerely,

Todd R. Campbell

Subject: Request to Postpone LCFS
Comment:

On behalf of River City Petroleum, we represent our concerns regarding the Low Carbon Fuel Standards set to be implemented in January for the upcoming year. After reading, analyzing and speaking with peers in the industry, it is apparent numerous unanswered questions remain regarding the regulation. Will the costs of the implementation truly outweigh its benefits? It is apparent that it will cost a significant amount of money to achieve the stated goals as the standard is currently laid out. What is troublesome is that a definitive answer as to what is to be accomplished has yet to be answered. Whatever it is, the costs will ultimately be passed on to consumers. How much of an increase will they pay at the pump? Is it realistic to expect consumers to pay these increases with the current economy in such an unstable state? Accompanying our concern for costs; how it is expected the supply of "low carbon" fuel to be sustainable, especially if other states are expected to implement similar programs. The LCFS bill makes clear the methods for finding the Carbon Intensity are imperfect and "subject to change" based on new findings. This instills very little confidence in the program, when there are many questions left unanswered. River City Petroleum therefore requests the implementation of the Low Carbon Fuel Standard be postponed until all costs and benefits of the program are weighed out and a more accurate measurement of them are able to be derived.

Comment:

Dear CARB members,

I read with interest the S.F. Chronicle editorial this morning regarding your upcoming meeting tomorrow to consider amendments relaxing the Low Carbon Fuel Standards. I am writing to ask that the Board reject the oil industries requests to annually review these standards in light of progress in their reductions of greenhouse gas emissions from burning fossil fuels.

This is the time to stand firm behind these standards. Our state is a leader, nationally and internationally, in recognizing the need to take mitigating actions to move our economy to less polluting sources of fuels in order to avoid major climate change impacts to our society. We have seen in our recent history that establishing standards for change, and holding firm to these standards, creates the incentive and persuasion needed to establish new products to meet the tougher standards. We saw this with the automobile industry response to mileage standards: hold firm to the standard and the performance will come along, in fits and starts, with much objection and push back by the industry. Look at the progress the Western European countries have made in this regard, where gasoline is priced and taxed high enough to lead to small, efficient cars, less pollution, more public transit, etc. Certainly we can do as well in the United States, and even better here in California.

Thank you for considering my comments.

Comment:

Please do not adopt any amendments that would weaken California's Low Carbon Fuel Standard. Growing evidence suggests that human caused climate change is happening much faster than previously predicted with potentially devastating consequences for the future.

Industry will not make the necessary changes in energy practices without solid mandates such as the Low Carbon Fuel Standard. Please maintain California's leadership in the fight against climate change by leaving the Low Carbon Fuel Standard intact and even strengthening it where possible.

Thank you.

Tom Crosser
