## **1** Introduction

The Compliance Offset Protocol for Livestock Manure (Digester) Projects provides methods to quantify and report greenhouse gas (GHG) emission reductions associated with the installation of a biogas control system (BCS) for manure management on dairy cattle and swine farms. The protocol focuses on quantifying the change in methane emissions, but also accounts for effects on carbon dioxide emissions. The protocol is based on the Climate Action Reserve's Livestock Project Protocol Version 2.2<sup>1</sup> and includes some clarifications and updates from proposed in the draft Version  $3.0_{-2}^{-2}$ .

Offset Project Operators or Authorized Project Designees that install manure biogas capture and destruction technologies use the methods contained in this <u>protocol</u>document to quantify and report GHGs. The protocol provides eligibility rules, methods to quantify <u>GHG</u> reductions, <u>offset</u> project-monitoring instructions, and procedures for <u>preparing</u> reporting  $\Theta$  offset P roject d data r eports. Additionally, all <u>offset</u> projects must submit to annual, independent verification by ARB-accredited verification bodies. Requirements for verification bodies to verify  $\Theta$  offset P roject emissions d data r eports are provided in the <u>Cap and Trade</u> Regulation (Regulation).

This protocol is designed to ensure the complete, consistent, transparent, accurate, and conservative quantification of GHG emission reductions associated with a livestock digester project. The protocol is comprised of both quantification methodologies and regulatory program requirements to develop a livestock project and generate complianceARB or registry offset credits.

AB 32 exempts quantification methodologies from the Administrative Procedure Act (APA)<sup>3</sup>, however those elements of the protocol are still regulatory. The exemption allows future updates to the quantification methodologies to be made through a public review and Board adoption process but without the need for rulemaking documents. Each protocol identifies sections that are considered quantification and exempt from APA requirements. Any changes to the non-quantification elements of the offset protocols would be considered a regulatory update subject to the full regulatory development process. Those sections that are considered to be a quantification methodology are clearly indicated in the title of the chapter or subchapter if only a portion of that chapter is considered part of the quantification methodology of the protocol.

## 2 The GHG Reduction Project

#### 2.1 Background

Manure treated and stored under anaerobic conditions decomposes to produce methane, which, if uncontrolled, is emitted to the atmosphere. This predominantly occurs when livestock operations manage waste with anaerobic liquid-based systems (e.g. in lagoons, ponds, tanks, or pits). Within the livestock sector, the primary drivers of methane generation include the amount of manure produced and the fraction of volatile solids that decompose anaerobically. Temperature and the retention time of manure during treatment and storage also affect methane production.

#### 2.2 Project Definition – Quantification Methodology

For the purposes of this protocol, the GHG reduction<u>offset</u> project is defined as the installation of a biogas control system that captures and destroys methane gas from anaerobic manure treatment and/or storage facilities on livestock operations.<sup>4</sup> The biogas control system must destroy methane gas that would otherwise have been emitted to the atmosphere in the absence of the <u>offset</u> project from uncontrolled anaerobic treatment and/or storage of manure.<sup>5</sup>

Captured biogas can be destroyed on-site, or transported for off-site use (e.g. through gas distribution or transmission pipeline), or used to power vehicles. Regardless of how offset project operators or authorized project designees take advantage of the captured biogas is utilized, the ultimate fate of the methane must be destruction.

"Centralized digesters" that integrate waste from more than one livestock operation may also meet the definition of an offset project.<sup>6</sup>

#### 2.3 The Offset Project Operator or Authorized Project Designee

The  $\Theta$ Offset  $\beta$ Project  $\Theta$ Operator or aAuthorized  $\beta$ Project dDesignee is responsible for project listing, monitoring, reporting and verification. The  $\Theta$ Offset  $\beta$ Project  $\Theta$ Operator or aAuthorized  $\beta$ Project dDesignee must submit the information in the Regulation and in Appendix C of this protocol to meet the listing requirements in the Regulation. The Offset Project Operator or Authorized Project Designee must have legal authority to implement the offset project.

<sup>&</sup>lt;sup>4</sup> Biogas control systems are commonly called digesters, which may be designed and operated in a variety of ways, from ambient temperature covered lagoons to heated lagoons to mesophilic plug flow or complete mix concrete tank digesters. <sup>5</sup> The installation of a BCS at an existing livesteek excertion where the use

<sup>&</sup>lt;sup>5</sup> The installation of a BCS at an existing livestock operation where the primary manure management system is aerobic (produces little to no methane) may result in an increase of the amount of methane emitted to the atmosphere. Thus, the BCS must digest manure that would primarily be treated in an anaerobic system in the absence of the project in order for the project to meet the definition of an offset project.
<sup>6</sup> The protocol also does not preclude Offset pProject eOperators or Authorized Project Designees from co-digesting.

<sup>&</sup>lt;sup>6</sup> The protocol also does not preclude <u>Offset PProject eOperators or Authorized Project Designees</u> from co-digesting organic matter in the biogas control system. However, the additional organics could impact the nutrient properties of digester effluent, which <u>Offset PProject eOperators or Authorized Project Designees</u> should consider when assessing the <u>offset</u> project's associated water quality impacts.

## 3 Eligibility Rules

<u>Offset</u> Pprojects thatmust meet the project definition and requirements in section 2.2of an offset project and must fully satisfy the eligibility requirements rules in the Regulation in order to receive an offset credit in addition to the eligibility rules listed below to be eligible to receive ARB or registry offset credits.

#### 3.1 Location

Only projects located in the United States and its territories, or on U.S. tribal lands, are eligible to create compliance offset credits under this protocol. In addition, offset projects situated on the following categories of land are only eligible under this protocol if they meet the requirements of this protocol and the Regulation, including the waiver of sovereign immunity requirements of section 95975(I) of the Regulation:

- 1. Land that is owned by, or subject to an ownership or possessory interest of a Tribe;
- 2. Land that is "Indian lands" of a Tribe, as defined by 25 U.S.C. §81(a)(1); or
- 3. Land that is owned by any person, entity, or Tribe, within the external borders of such Indian lands.

#### 3.2 Offset Project Commencement

<u>For this protocol, OffsetThe pProject cCommencement is defined as the date at which the offset project's biogas control system (BCS) becomes operational.</u> For the purposes of this protocol, a<u>A</u> BCS is considered *operational* on the date at which the system begins producing and destroying methane gas upon completion of an initial start-up period. Projects with commencement dates prior to December 31, 2006 are not eligible under this protocol. Offset Pprojects may always be submitted for listing prior to their commencement date.

### 3.3 Project Crediting Period

Offset project operators or authorized project designees are eligible to create GHG reductions for compliance offsets according to The crediting period for this protocol for a period of is ten years. following the project's commencement date.

#### 3.4 Anaerobic Baseline - Quantification Methodology

Offset project operators or authorized project designees must demonstrate that the depth of the anaerobic lagoons or ponds prior to the project's implementation were sufficient to prevent algal oxygen production and create an oxygen-free bottom layer; which means at least 1 meter in depth.

Greenfield livestock projects (i.e., projects that are implemented at new livestock facilities that have no prior manure management system) are eligible only if the offset project operator or authorized project designee can demonstrate that uncontrolled anaerobic storage and/or treatment of manure is common practice in the industry and geographic region where the project is located.

#### 3.4 3.5 Additionality

The protocol<u>Offset projects</u> must meet the additionality requirements in the Regulation in addition to the requirements below. In summary, the activity must not be required by or undertaken to comply with any federal, state, local law or ordinance, or other legally binding mandates in the project's jurisdiction.

#### 3.4.1 Anaerobic Baseline - Quantification Methodology

<u>The oOffset pProject oOperator or aAuthorized pProject dDesignee\_must demonstrate</u> that the depth of the anaerobic lagoons or ponds prior to the <u>offset project's</u> implementation were sufficient to prevent algal oxygen production and create an oxygen-free bottom layer; which means at least 1 meter in depth.

Greenfield livestock projects (i.e., projects that are implemented at new livestock facilities that have no prior manure management system) are eligible only if the eOffset pProject eOperator or aAuthorized pProject dDesignee can demonstrate that uncontrolled anaerobic storage and/or treatment of manure is common practice in the industry and geographic region where the offset project is located.

#### 3.56 Regulatory Compliance

As stated in the Regulation, an eOffset pProject eOperators or aAuthorized pProject dDesignees must fulfill all applicable local, regional and national requirements on environment impact assessments that apply based on the offset project location. Offset Pprojects must also meet any otherfulfill all local, regional, and national regulatory requirements that might apply based on the offset project location. Offset Pprojects are not eligible to receive ARB or registry offset credits for GHG reductions or GHG removal enhancements that occur as the result of collection or destruction activities are not in compliance with regulatory requirements.

### 4 The GHG Assessment Offset Project Boundary – Quantification Methodology

The GHG AssessmentOffset Project Boundary delineates the GHG sources, GHG sinks, and GHG reservoirs (SSRs) that shall be assessed by offset project operators or authorized project designees to determine the net change in emissions associated with installing a BCS. For T this protocol,'s the Offset Project assessment bBoundary captures sources from waste production to disposal, including off-site manure disposal. However, the calculation procedure only incorporates methane and carbon dioxide, so while nitrous oxide sources are technically within the Offset Project bBoundary they are not assessed in the calculation procedure.

This protocol does not account for carbon dioxide emission reductions associated with displacing grid-delivered electricity or fossil fuel use.

CO<sub>2</sub> emissions associated with the generation and destruction of biogas are considered biogenic emissions<sup>7</sup> (as opposed to anthropogenic) and are not included in the GHG Assessment Boundary.

Table 4.1 provides greater detail on each SSR and information for the SSRs and gases from the GHG AssessmentOffset Project Boundary.

<sup>&</sup>lt;sup>7</sup>-The rationale is that carbon dioxide emitted during combustion represents the carbon dioxide that would have been emitted during natural decomposition of the manure. Emissions from the biogas control system do not yield a net increase in atmospheric carbon dioxide because they are theoretically equivalent to the carbon dioxide absorbed during plant/feed growth.

#### Air Resources Board Compliance Offset Protocol Livestock Manure (Digester) Projects Protocol

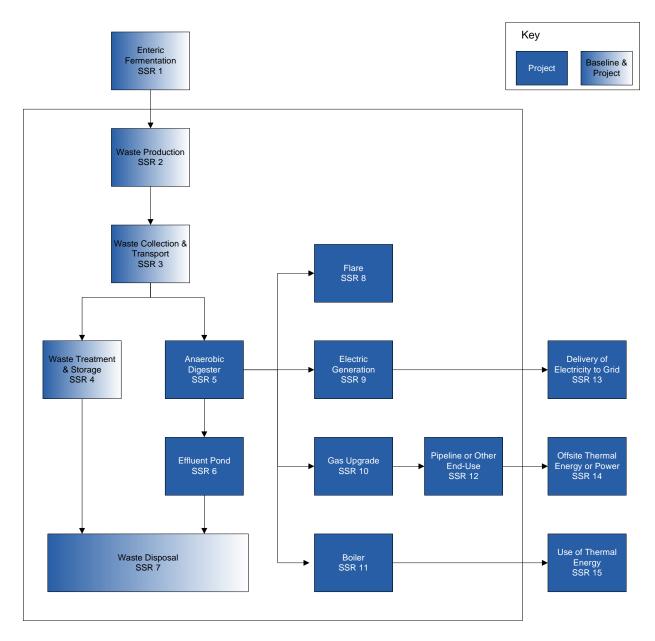

Figure 4.1. General Illustration of the GHG Assessment Offset Project Boundary

Table 4.1 relates GHG source categories to sources and gases, and indicates inclusion in the calculation methodology. It is intended to be illustrative – GHG sources are indicative for the source category, GHGs in addition to the main GHG are also mentioned, where appropriate.

| SSR | GHG Source  | Gas                             | Relevant to<br><u>Project</u><br>Baseline (B)<br>or <u>Offset</u><br>Project (P) | Included/<br>Excluded |  |

# 5 Quantifying GHG Emission Reductions – Quantification Methodology<sup>87</sup>

GHG emission reductions from a livestock <u>offset</u> project are quantified by comparing actual project emissions to baseline emissions at the <u>offset</u> project site. <u>Project</u> <u>B</u><u>b</u>aseline emissions are an estimate of the GHG emissions from <u>GHG</u> sources within the <del>GHG</del> AssessmentOffset Project</u> Boundary that would have occurred in the absence of the livestock <u>offset</u> project. Project emissions are actual GHG emissions that occur at sources within the <del>GHG</del> AssessmentOffset Project baseline emissions to quantify the <u>offset</u> project's total net GHG emission reductions (Equation 5.1)<del>-</del>, and the total number of GHG reductions submitted for issuance of ARB or registry offset credits must be rounded to the nearest whole ton.

<u>The</u> eOffset pProject eOperators or aAuthorized pProject dDesignees should take note that some equations to calculate <u>project</u> baseline and project emissions are run on a month-by-month basis and activity data monitoring takes place at varying levels of frequency. As applicable, monthly emissions data (for <u>project</u> baseline and <u>offset</u> project) are summed together to calculate annual <u>GHG</u> emission reductions.

The current methodology for quantifying the GHG impact<u>emissions and GHG emission</u> reductions associated with installing a BCS requires the use of both modeled reductions (following Equation 5.2 to Equation 5.4 and Equation 5.6 to Equation 5.9), as well as the utilization of ex-post metered data from the BCS to be used as a check on the modeled <u>GHG</u> reductions.

ARB recognizes that t<u>T</u>here can be material differences between modeled methane emission reductions and the actual metered quantity of methane that is captured and destroyed by the BCS due to digester start-up periods, venting events, and other BCS operational issues. These operational issues have the potential to result in substantially less methane destruction than is modeled, leading to an overestimation of GHG reductions in the modeled case.

To address this issue and maintain consistency with international best practice, ARB requires the modeled methane emission reduction results to be compared to the ex-post metered quantity of methane that is captured and destroyed by the BCS. The lesser of the two values will represent the total methane emission reductions for the reporting period. Equation 5.1 below outlines the quantification methodology for calculating the <u>GHG</u> emission reductions from the installation of a BCS.<sup>98</sup>

<sup>&</sup>lt;sup>87</sup>The entirety of Section 5 is considered a quantification method.

<sup>&</sup>lt;sup>98</sup>The calculation procedure only addresses direct emissions sources and does not incorporate <del>changes</del><u>reductions</u> in electricity consumption, which impacts indirect emissions associated with power plants owned and operated by entities other than the <u>Offset</u><u>Project Operator or Authorized Project Designee</u><u>livestock operator</u>. <u>Equation 5.1 accounts for any increase in CO2 if the project results in an increase in electricity consumption</u>.

#### Equation 5.1. GHG Reductions from Installing a Biogas Control System

Total GHG Reductions = (Modeled <u>project</u> baseline emissions  $_{CH4}$  - Project emissions  $_{CH4}$ ) + (<u>project</u> <u>B</u><u>b</u>aseline emissions  $_{CO2}$  - Project emissions  $_{CO2}$ )

The (*Modeled* <u>project</u> baseline emissions  $_{CH4,}$  – Project emissions  $_{CH4}$ ) term shall be calculated according to Equation 5.2 to Equation 5.4 and Equation 5.6 to Equation 5.9. The resulting aggregated quantity of methane reductions must then be compared to the ex-post quantity of methane that is metered and destroyed in the biogas collection system, as expressed in Equation 5.10. In the case that the total ex-post quantity of metered and destroyed methane is less than the modeled methane reductions, the metered quantity of destroyed methane will replace the modeled methane reductions.

Therefore, the above equation then becomes:

Total GHG Reductions = (Total quantity of metered and destroyed methane) + (<u>Project b</u>Baseline emissions <sub>co2</sub> – Project emissions <sub>co2</sub>)

#### 5.1 Quantifying Baseline Methane Emissions

<u>Project Bb</u>aseline emissions represent the GHG emissions within the GHG assessmentOffset Project bBoundary that would have occurred if not for the installation of the BCS. For the purposes of this protocol, offset project operators or authorized project designees calculate theirproject baseline emissions must be calculated according to the manure management system in place prior to installing the BCS. This is referred to as a "continuation of current practices" project baseline scenario. Additionally, offset project operators or authorized project designees calculateproject baseline emissions must be calculated each year of the offset project.<sup>409</sup> The procedure assumes there is no BCS in the project operators or authorized project designees a modeled project baseline scenario must be established a modeled baseline scenario using the prevailing system type in use for the geographic area, animal type, and farm size that corresponds to their operation.

The procedure to determine the modeled <u>project</u> baseline methane emissions follows Equation 5.2, which combines Equation 5.3 and Equation 5.4.

Equation 5.3 calculates methane emissions from anaerobic manure storage/treatment systems based on site-specific information on the mass of volatile solids degraded by the anaerobic storage/treatment system and available for methane conversion.<sup>44</sup> <sup>10</sup> It incorporates the effects of temperature through the van't Hoff-Arrhenius '*f* factor and accounts for the retention of volatile solids through the use of monthly assessments. Equation 5.4 is less intensive and applies to non-anaerobic storage/treatment systems. Both Equation 5.3 and Equation 5.4 reflect basic biological principles of methane

<sup>&</sup>lt;sup>40 9</sup>Conversely, under a "static baseline," a project operator would assess the project baseline emissions would be assessed once before offset project implementation and use that value would be used throughout the offset project lifetime.

<sup>&</sup>lt;sup>44</sup> 10 Anaerobic storage/treatment systems generally refer to anaerobic lagoons, or storage ponds, etc.

production from available volatile solids, determine methane generation for each livestock category, and account for the extent to which the waste management system handles each category's manure.

#### Box 5.1. Daily Volatile Solids for All Livestock Categories

Consistent with international best-practice, it is recommended that appropriate VS<sub>L</sub> values for Dairy livestock categories be obtained from the State-specific lookup tables (Tables BA.5.a – B.5.f) provided in Appendix A. When possible, use the year corresponding to the appropriate emission year. If the current year's table is not available, use the most current year.

VS<sub>L</sub> values for all other livestock can be found in Appendix A, Table A.3.

*Important* - Units provided for all VS values in Appendix A are in (kg/day/1000kg), in order to get VS<sub>L</sub> in the appropriate units (kg/animal/day), the following equation must be used:

$$\begin{split} VS_{L} &= VS_{table} \times \frac{Mass_{L}}{1000} \\ Where, & & \\ VS_{L} &= & Volatile solid excretion on a dry matter weight basis & kg/ animal/ day \\ VS_{Table} &= & Volatile solid excretion from lookup table (Table A.3 and Table & kg/ day/ 1000kg \\ & A.5a. - A.5.d.) \\ Mass_{L} &= & Average live weight for livestock category 'L', if site specific data \\ & is unavailable, use values from Appendix A, Table A.2 \end{split}$$

#### 5.1.1 Variables for Calculating <u>Project</u> Baseline Methane

The calculation procedure uses a combination of site-specific values and default factors.

#### Population – PL

The procedure requires offset project operators or authorized project designees the <u>offset project</u> to differentiate between livestock categories ('L') – e.g. lactating dairy cows, non-milking dairy cows, heifers, etc. This accounts for differences in methane generation across livestock categories (see Appendix A, Table A.2). The population of each livestock category is monitored on a monthly basis, and for Equation 5.4 averaged for an annual total population.

#### Volatile <u>S</u>solids – VS<sub>L</sub>

This value represents the daily organic material in the manure for each livestock category and consists of both biodegradable and non-biodegradable fractions. The VS content of manure is a combination of excreted fecal material (the fraction of a livestock category's diet consumed and not digested) and urinary excretions, expressed in a dry matter weight basis (kg/animal). This protocol requires that the VS value for all livestock categories be determined as outlined in Box 5.1.

#### Mass∟

This value is the annual average live weight of the animals, per livestock category. This data is necessary because default VS values are supplied in units of kg/day/1000kg mass, therefore the average mass of the corresponding livestock category is required in order to convert the units of VS into kg/day/animal. Site specific livestock mass is preferred for all livestock categories. If site specific data is unavailable, Typical Average Mass (TAM) values can be used (Appendix A, Table A.2).

#### Maximum methane production – B<sub>0,L</sub>

This value represents the maximum methane-producing capacity of the manure, differentiated by livestock category ('L') and diet. Offset project operators or authorized project designees use the dDefault B<sub>0</sub> factors from Appendix A, Table A.3 <u>must be used</u>.

#### MS

The MS value apportions manure from each livestock category to an appropriate manure management system component ('S'). It reflects the reality that waste from the operation's livestock categories are not managed uniformly. The MS value accounts for the operation's multiple types of manure management systems. It is expressed as a percent (%), relative to the total amount of waste produced by the livestock category. As waste production is normalized for each livestock category, the percentage should be calculated as percent of population for each livestock category. For example, a dairy operation might send 85% of its milking cows' waste to an anaerobic lagoon and 15% could be deposited in a corral. In this situation an MS value of 85% would be assigned to Equation 5.3 and 15% to Equation 5.4.

Importantly, the MS value indicates where the waste would be managed in the <u>project</u> baseline scenario – i.e. where the manure would end-up if the digester was never installed.

#### Methane <u>c</u>onversion <u>f</u>actor – MCF

Each manure management system component has a volatile solids-to-methane conversion efficiency, which represents the degree to which maximum methane production ( $B_0$ ) is achieved. Methane production is a function of the extent of anaerobic conditions present in the system, the temperature of the system, and the retention time of organic material in the system.

According to this protocol, <u>fF</u>or anaerobic lagoons, storage ponds, liquid slurry tanks etc., <u>offset project operators or authorized project designees perform a this protocol</u> <u>requires</u> site-specific calculation of the mass of volatile solids degraded by the anaerobic storage/treatment system. This is expressed as "degraded volatile solids" or "VS<sub>deg</sub>" in Equation 5.3, which equals the system's monthly available <u>VS</u><del>volatile solids</del> multiplied by "f," the van't Hoff-Arrhenius factor. The 'f' factor effectively converts total available <u>VS</u><del>volatile solids</del> in the anaerobic manure storage/treatment system to methane-convertible <u>VS</u><del>volatile solids</del>, based on the monthly temperature of the system.

The multiplication of "VS<sub>deg</sub>" by "B<sub>0</sub>" gives a site-specific quantification of the uncontrolled methane emissions that would have occurred in the absence of a digester – from the anaerobic storage and/or treatment system, taking into account each livestock category's contribution of manure to that system.

This method to calculate methane emissions reflects the site-specific monthly biological performance of the operation's anaerobic manure handling systems that existed preproject, as predicted by the van't Hoff-Arrhenius equation using farm-level data on temperature, VS loading, and system VS retention time.

Default MCF values for non-anaerobic manure storage/treatment are available in Appendix A, which are used for Equation 5.4.

#### 5.2 Quantifying Project Methane Emissions

Project emissions are actual GHG emissions that occur within the GHG Assessment Offset Project Boundary after the installation of the BCS. Project emissions are calculated on an annual, *ex-post* basis. But like <u>project</u> baseline emissions, some parameters are monitored on a monthly basis. Methane emissions from manure storage and/or treatment systems other than the digester are modeled much the same as in the baseline scenario.

As shown in Equation 5.5, project methane emissions equal:

- The amount of methane created by the BCS that is not captured and destroyed by the control system, plus
- Methane from the digester effluent storage pond (if necessary), plus

 Methane from sources in the waste treatment and storage category other than the BCS and associated effluent pond. This includes all other manure treatment systems such as compost piles, solids storage, daily spread, etc.

Consistent with ACM0010 and this protocol's <u>project</u> baseline methane calculation approach, the formula to account for project methane emissions incorporates all potential <u>GHG</u> sources within the waste treatment and storage category. Non-BCS-related sources follow the same calculation approach as provided in the <u>project</u> baseline methane equations. Several activity data for the variables in Equation 5.9 will be the same as those in Equation 5.2 – Equation 5.4.

Although not common under normal digester operation, it is possible that a venting event may occur due to failure of digester cover materials, the digester vessel, or the gas collection system, or due to a planned maintenance event. In the event that a system failure or planned operation results in the venting of biogas, the quantity of methane released to the atmosphere shall be estimated according to Equation 5.7.

#### 5.3 Metered Methane Destruction Comparison

As described above, <u>ARB requires all offset projects must</u> compare the modeled methane emission reductions for the reporting period, as calculated in Equation 5.2 - Equation 5.4 and Equation 5.6 - Equation 5.9 above, with the actual metered amount of methane that is destroyed in the BCS over the same period. The lesser of the two values is to be used as the total methane emission reductions for the reporting period in question.

In order to calculate the metered methane reductions, the monthly quantity of biogas that is metered and destroyed by the BCS must be aggregated over the reporting period. In the event that an the oOffset pProject oOperator or aAuthorized pProject dDesignee is reporting GHG reductions for a period of time that is less than a full year, the total modeled methane emission reductions would be aggregated over this time period and compared with the metered methane that is destroyed in the BCS over the same period of time. For example, if a project is reporting and verifying only 6 months of data, July – December for instance, the modeled emission reductions over this 6

<sup>&</sup>lt;sup>47</sup> 16 According to this protocol, non-BCS-related sources means manure management system components (system component 'S') other than the biogas control system and the BCS effluent pond (if used).

month period would be compared to the total metered biogas destroyed over the same six month period, and the lesser of the two values would be used as the total methane emission reduction quantity for this 6 month period.

Equation 5.10 below details the metered methane destruction calculation.

| Equation 5.10. Metered M | Methane Destruction |
|--------------------------|---------------------|
|--------------------------|---------------------|

|                           | _      | $H_{4,meter} \times BDE_{i,weighted}) \times 21$   |                       |
|---------------------------|--------|--|-----------------------|
| Where,                    | months |  | <u>Units</u>          |
| CH <sub>4,destroyed</sub> | =      | Aggregated quantity of methane collected and destroyed during the reporting period                               | tCO <sub>2</sub> e/yr |
| CH <sub>4,meter</sub>     | =      | Monthly quantity of methane collected and metered. See Equation 5.6  | tCH₄/<br>month        |
| BDE <sub>i,weighted</sub> | =      | Monthly weighted average of all destruction devices used in month i <sup>48</sup> <sup>17</sup> See Equation 5.6 | % (as a decimal)      |
| 21                        | =      | Global Warming Potential factor of methane to carbon dioxide equivalent  | ,                     |

#### Determining the methane emission reductions

- If CH<sub>4,destroyed</sub> is less than (BE<sub>CH4</sub> PE<sub>CH4</sub>) as calculated in Equation 5.2 -Equation 5.4 and Equation 5.6 - Equation 5.9 for the reporting period, the methane emission reductions are equal to CH<sub>4,destroyed</sub>
- Otherwise, the methane emission reductions are equal to (BE<sub>CH4</sub> PE<sub>CH4</sub>)

#### 5.4 Quantifying <u>Project</u> Baseline and Project Carbon Dioxide Emissions

Sources of c<u>C</u>arbon dioxide emissions associated with <u>the project baseline or a-project activities</u>may include <u>sources like</u> electricity use by pumps and equipment, fossil fuel generators used to <u>destroy biogas or power pumping systems or milking parlor</u> equipment, <u>flares</u>, tractors that operate in barns or freestalls, on-site manure hauling trucks, or vehicles that transport manure off-site. Changes in carbon dioxide emissions from these sources may be small, but a <u>Any</u> net increase in emissions shall be accounted for. Offset project operators or authorized project designees may either <u>uU</u>se Equation 5.11 to calculate the net change in carbon dioxide emissions are estimated to be equal to or less than 5% of the total <u>project</u> baseline emissions of methane, the offset project operator or authorized project designee may estimate <u>project</u> baseline and project carbon dioxide emissions within the <u>GHG</u> Assessment <u>Offset Project</u> Boundary must be verified and included in <u>GHG</u> emission reduction calculations.

<sup>&</sup>lt;sup>48</sup> <u>17</u> <u>The Offset</u> Project <u>eOperators</u> <u>or Authorized Project Designee-havehas</u> the option to use either the default methane destruction efficiencies provided, or site specific methane destruction efficiencies as provided by an ARB approved source test plan, for each of the combustion devices used in the project.

If calculations or estimates indicate that the <u>offset</u> project results in a net decrease in carbon dioxide emissions from grid-delivered electricity, mobile and stationary sources, then for quantification purposes the net change in these emissions must be specified as zero (i.e.,  $CO_{2,net} = 0$  in Equation 5.11).

Carbon dioxide emissions from the combustion of biogas are considered biogenic emissions and are excluded from the GHG Assessment Boundary.

Equation 5.11 below calculates the net change in anthropogenic carbon dioxide emissions resulting from the <u>offset project activity</u>.

| •  | <sup>CO2MSC</sup> - PE <sub>CO2MSC</sub> )  |   |

### 6 <u>Offset</u> Project Documentation and Monitoring Requirements

<u>The</u>  $\Theta$  offset  $\beta$  Project  $\Theta$  operators or a Authorized  $\beta$  Project d Designees are is responsible for monitoring the performance of the <u>offset</u> project and operating each component of the biogas collection and destruction system in a manner consistent with the manufacturer's specifications. The methane capture and control system must be monitored with measurement equipment that directly meters:

- 1. The total flow of biogas, measured continuously and recorded every 15 minutes or totalized and recorded at least daily, adjusted for temperature and pressure, prior to delivery to the destruction device(s)
- The flow of biogas delivered to each destruction device<sup>1918</sup>, measured continuously and recorded every 15 minutes or totalized and recorded at least daily, adjusted for temperature and pressure
- 3. The fraction of methane in the biogas, measured with a continuous analyzer or, alternatively, with quarterly measurements

Flow data must be corrected for temperature and pressure at 60°F and 1 atm, either internally or by following Equation 5.6.

**Figure 6.1** represents the suggested arrangement of the biogas flow meters and methane concentration metering equipment.

Note: The number of flow meters must be sufficient to track the total flow as well as the flow to each combustion device. The above example includes one more flow meter than would be necessary to achieve this objective.

<sup>&</sup>lt;sup>1918</sup>A single meter maymust be used for multiple, identical for each destruction devices. In this instance, methane destruction in these units will be eligible only if both units are monitored to be operational, even if the destruction device is identical.

Operational activity of the destruction devices shall be monitored and documented at least hourly to ensure actual methane destruction. GHG reductions will not be accounted for or credited during periods in which the destruction device is not operational.

If for any reason the destruction device or the operational monitoring equipment (for example, the thermal coupler on the flare) is inoperable, all metered biogas going to the particular device shall be assumed to be released to atmosphere during the period of inoperability. During the period of inoperability, the destruction efficiency of the device must be assumed to be zero. In Equation 5.10, the monthly <u>biogas</u> destruction efficiency (BDE) value shall be adjusted accordingly. See Box 6.1 for an example BDE adjustment.

#### Box 6.1. Example BDE Adjustment

As an example, consider a situation where the primary destruction device is an open flare with a BDE of 96%, and it is found to be inoperable for a period of 5 days of a 30 day month. Assume that the total flow of biogas to the flare for the month is 3,000,000 scf, and that the total flow recorded for the 5 day period of inoperability is 500,000 SCF. In this case the monthly BDE would be adjusted as follows:

BDE =[(0.96\*2,500,000) +(0.0 \* 500,000)] / 3,000,000 = 80%

## 6.1 6.1.1 Biogas Measurement Instrument QA/QC – Quantification Methodology

All gas flow meters<sup>20</sup> and continuous methane analyzers must be:

- Cleaned and inspected on a quarterly basis, with the activities performed and "as found/as left condition" of the equipment documented
- Field checked by a trained professional for calibration accuracy with the percent drift documented, using either a portable instrument (such as a pitot tube)<sup>21</sup> or manufacturer specifications, at the end of but no more than two months prior to the end date of the reporting period<sup>22</sup>
- Calibrated by the manufacturer or a certified calibration service per manufacturer's specifications or every 5 years, whichever is more frequent

If the field check on a piece of equipment reveals accuracy outside of a +/- 5% threshold, calibration by the manufacturer or a certified service provider is required for that piece of equipment.

<sup>&</sup>lt;sup>20</sup> <sup>19</sup> Field checks and calibrations of flow meters shall assess the volumetric output of the flow meter.

<sup>&</sup>lt;sup>24</sup> <sup>20</sup>It is recommended that a professional third party calibration service be hired to perform flow meter field checks if using pitot tubes or other portable instruments, as these types of devices require professional training in order to achieve accurate readings.

achieve accurate readings. <sup>22</sup> <sup>21</sup>Instead of performing field checks, the <u>Offset <del>p</del></u>Project <del>o</del><u>O</u>perators <u>or Authorized Project Designees</u> may instead have equipment calibrated by the manufacturer or a certified calibration service per manufacturer's specifications, at the end of but no more than two months prior to the end date of the reporting period to meet this requirement.

For the interval between the last successful field check and any calibration event confirming accuracy below the +/- 5% threshold, all data from that meter or analyzer must be scaled according to the following procedure. These adjustments must be made for the entire period from the last successful field check until such time as the meter is properly calibrated.

- 1. For calibrations that indicate under-reporting (lower flow rates, or lower methane concentration), the metered values must be used without correction.
- 2. For calibrations that indicate over-reporting (higher flow rates, or higher methane concentration), the metered values must be adjusted based on the greatest calibration drift recorded at the time of calibration.

For example, if a project conducts field checks quarterly during a year-long reporting period, only three months of data will be subject at any one time to the penalties above. However, if the  $\Theta$  ffset P roject  $\Theta$  perator or a Authorized P roject d besignee feels confident that the meter does not require field checks or calibration on a greater than annual basis, then failed events will accordingly require the penalty to be applied to the entire year's data. Frequent calibration may minimize the total accrued drift (by zeroing out any error identified), and result in smaller overall deductions.

In order to provide flexibility in verification, data monitored up to two months after a field check may be verified. As such, the end date of the reporting period must be no more than two months after the latest successful field check.

If a portable instrument is used (such as a handheld methane analyzer), the portable instrument shall be calibrated at least annually by the manufacturer or at an ISO 17025 accredited laboratory.

#### 6.1.1 6.1.2 Missing Data – Quantification Methodology

In situations where the flow rate or methane concentration monitoring equipment is missing data, the eOffset pProject eOperator or aAuthorized pProject dDesignee shall apply the data substitution methodology provided in Appendix B. If for any reason the destruction device monitoring equipment is inoperable (for example, the thermal coupler on the flare), no emission reductions can be credited for the period of inoperability.

#### 6.2 Monitoring Parameters – Quantification Methodology

Provisions for monitoring other variables to calculate <u>project</u> baseline and project emissions are provided in Table 6.1. The parameters are organized by general project factors and then by the calculation methods.

|             | I able 6.1. Project Monitoring Parameters   |                              |  |                          |  |  |  |

# 7 Reporting Parameters

<u>General requirements for reprinting and record retention are included in the Regulation.</u> <u>This section includes additional requirements specific to this protocol.</u><u>This section</u> <u>provides requirements on reporting and procedures.</u> It is a<u>A</u> priority <u>of this protocol is</u> to facilitate consistent and transparent information disclosure <u>among project operators by</u> <u>Offset Project Operators or Authorized Project Designees.</u>

### 7.1 Annual Reporting Requirements

<u>The</u> Offset pProject eOperators or aAuthorized pProject dDesignees must submit an Offset Project Data rReport information contained in Appendix Daccording to the requirements in the Regulation. The Offset Project Data Report must include the information listed in the Regulation and this protocol and cover a single Reporting Period. See the Regulation and Appendix D for specific requirements.

### 7.2 Document Retention

<u>The</u> Offset pProject operators or aAuthorized pProject dDesignees are is required to keep all <u>documentation and information</u> outlined in this protocol as required in the Regulation and this protocol. Records retention requirements are set forth in the <u>Regulation</u>. must be retained for a period of 5 years after the end of the crediting period.

#### System Information that should be retained by the <u>Offset <del>p</del>P</u>roject <del>o</del><u>O</u>perator or <u>aA</u>uthorized <u>pP</u>roject <u>dD</u>esignee should include, but is not limited to:

- All data inputs for the calculation of the <u>project</u> baseline emissions and project emission reductions
- CO<sub>2</sub>e annual tonnage calculations
- Relevant sections of the BCS operating permits
- BCS information (installation dates, equipment list, etc.)
- Biogas flow meter information (model number, serial number, manufacturer's calibration procedures)
- Cleaning and inspection records for all biogas meters
- Field check results for all biogas meters
- Calibration results for all biogas meters
- Methane monitor information (model number, serial number, calibration procedures)
- Biogas flow data (for each flow meter)
- Biogas temperature and pressure readings (only if flow meter does not correct for temperature and pressure automatically)
- Methane concentration monitoring data
- Destruction device monitoring data (for each destruction device)
- Destruction device, methane monitor and biogas flow monitor information (model numbers, serial numbers, calibration procedures)
- All maintenance records relevant to the BCS, monitoring equipment, and destruction devices

#### If using a calibrated portable gas analyzer for CH<sub>4</sub> content measurement:

- Date, time, and location of methane measurement
- Methane content of biogas (% by volume) for each measurement
- Methane measurement instrument type and serial number
- Date, time, and results of instrument calibration
- Corrective measures taken if instrument does not meet performance specifications

See the Regulation for record-keeping requirements.

### 7.3 Reporting Period & Verification Cycle

Offset project verification schedules are set forth in the Regulation. Offset project operators or authorized project designees must submit an Offset Project Data Report to ARB or an Offset Project Registry annually and be based on a single calendar year.

Verification must be performed annually and be based on a calendar year. A verification statement must be received by ARB by October 1 of the next calendar year for which the statement is verifying destruction.

# 8 Glossary of Terms<sup>23</sup>

| Accredited verifier  | A verification firm approved by ARB to provide<br>verification services for offset project operators or<br>authorized project designees.   |  |
|--|--|--|
| Additionality  | Manure management practices that are above and<br>beyond business-as-usual operation, exceed the<br>baseline characterization, and are not mandated by<br>regulation.  |  |
| Anaerobic  | Pertaining to or caused by the absence of oxygen.  |  |
| Anthropogenic emissions  | GHG emissions resultant from human activity that are<br>considered to be an unnatural component of the<br>Carbon Cycle (i.e. fossil fuel combustion, de-<br>forestation etc.).   |  |
| Biogas   | Gas that is produced from the breakdown of organic<br>material in the absence of oxygen. Biogas is<br>produced in processes including, but not limited to,<br>anaerobic digestion, anaerobic decomposition, and<br>thermochemical decomposition. These processes<br>are applied to biodegradable biomass materials, such<br>as manure, sewage, municipal solid waste, green<br>waste, and waste from energy crops, to produce<br>landfill gas, digester gas, and other forms of<br>biogas. The mixture of gas (largely methane)<br>produced as a result of the anaerobic decomposition<br>of livestock manure. |  |
| Biogas control system (BCS)  | A system designed to capture and destroy the biogas<br>that is produced by the anaerobic treatment and/or<br>storage of livestock manure and/or other organic<br>material. Commonly referred to as a "digester."   |  |
| Biogenic CO <sub>2</sub> emissions                                   | CO <sub>2</sub> emissions resulting from the combustion and/or<br>aerobic decomposition of organic matter. Biogenic<br>emissions are considered to be a natural part of the<br>carbon cycle, as opposed to anthropogenic<br>emissions.   |  |
| <del>Carbon dioxide</del><br><del>(CO<sub>2</sub>)</del>             | The most common of the six primary greenhouse gases, consisting of a single carbon atom and two oxygen atoms.  |  |
| <del>CO<sub>2</sub>-equivalent</del><br><del>(CO<sub>2</sub>e)</del> | The quantity of a given GHG multiplied by its total global warming potential. This is the standard unit for comparing the degree of warming which can be caused by different GHGs.   |  |
| Direct emissions   | Greenhouse gas emissions from sources that are<br>owned or controlled by the reporting entity.   |  |

<sup>&</sup>lt;sup>23</sup> For terms not defined in this section, the definitions in the Regulation apply.

#### Air Resources Board Compliance Offset Protocol Livestock Manure (Digester) Projects Protocol

| Emission factor                 | A unique value for determining an amount of a greenhouse gas emitted for a given quantity of activity data (e.g. metric tons of carbon dioxide emitted per barrel of fossil fuel burned).   |
|---------------------------------|---|
| Flare                           | A destruction device that uses an open flame<br>to burn combustible gases with combustion air<br>provided by uncontrolled ambient air around<br>the flame.  |
| Fossil fuel                     | A fuel, such as coal, oil, and natural gas,<br>produced by the decomposition of ancient<br>(fossilized) plants and animals.   |
| <del>Greenhouse gas (GHG)</del> | Carbon dioxide (CO <sub>2</sub> ), methane (CH <sub>4</sub> ), nitrous<br>oxide (N <sub>2</sub> O), sulfur hexafluoride (SF <sub>6</sub> ),<br>hydrofluorocarbons (HFCs), or<br>perfluorocarbons (PFCs).                                |
| Global Warming Potential (GWP)  | The ratio of radiative forcing (degree of warming to the atmosphere) that would result from the emission of one unit of a given GHG compared to one unit of CO <sub>2</sub> .   |
| Indirect emissions              | Emissions that are a consequence of the<br>actions of a reporting entity, but are produced<br>by sources owned or controlled by another<br>entity.  |
| Livestock project               | Installation of a biogas control system that, in operation, causes a decrease in GHG emissions from the baseline scenario through destruction of the methane component of biogas.   |
| Metric ton (MT) or "tonne"      | A common international measurement for the<br>quantity of GHG emissions, equivalent to about<br>2204.6 pounds or 1.1 short tons.  |
| Methane (CH <sub>4</sub> )      | A potent GHG with a GWP of 21, consisting of a single carbon atom and four hydrogen atoms.  |
| MMBtu                           | One million British thermal units.  |
| Mobile combustion               | Emissions from the transportation of materials,<br>products, waste, and employees resulting from<br>the combustion of fuels in company owned or<br>controlled mobile combustion sources (e.g.<br>cars, trucks, tractors, dozers, etc.). |
| Nitrous oxide (N₂O)             | A GHG consisting of two nitrogen atoms and a single oxygen atom.  |
| Project baseline                | A business-as-usual GHG emission<br>assessment against which GHG emission<br>reductions from a specific GHG reduction<br>activity are measured.   |

#### Air Resources Board Compliance Offset <u>Protocol</u> Livestock <u>Manure (Digester)</u> Projects <u>Protocol</u>

| Offset project operators or authorized project<br>designees | An entity that undertakes a project activity, as<br>identified in the Livestock Project Protocol. A<br>project operator may be an independent third<br>party or the dairy/swine operating entity.   |
|---|---|
| Stationary combustion source                                | A stationary source of emissions from the<br>production of electricity, heat, or steam,<br>resulting from combustion of fuels in boilers,<br>furnaces, turbines, kilns, and other facility<br>equipment.  |
| van't Hoff-Arrhenius factor                                 | The proportion of volatile solids that are<br>biologically available for conversion to methane<br>based on the monthly temperature of the<br>system.  |
| Verification  | The process used to ensure that a given<br>participant's greenhouse gas emissions or<br>emission reductions have met the minimum<br>quality standard and complied with ARB's<br>procedures and protocols for calculating and<br>reporting GHG emissions and emission<br>reductions. |
| Verification body   | An accredited firm that is able to render a<br>verification opinion and provide verification<br>services for operators subject to reporting<br>under this protocol.   |

# Appendix A Emission Factor Tables – Quantification Methodology

 Table A.1. Manure Management System Components

| System                                      | Definition  |
|---|---|
| Pasture/Range/<br>Paddock                   | The manure from pasture and range grazing animals is allowed to lie as deposited, and is not managed.   |
| Daily spread                                | Manure is routinely removed from a confinement facility and is applied to cropland or pasture within 24 hours of excretion.   |
| Solid storage                               | The storage of manure, typically for a period of several months, in unconfined piles or stacks. Manure is able to be stacked due to the presence of a sufficient amount of bedding material or loss of moisture by evaporation.   |
| Dry lot                                     | A paved or unpaved open confinement area without any significant vegetative cover where accumulating manure may be removed periodically.  |
| Liquid/Slurry                               | Manure is stored as excreted or with some minimal addition of water in either tanks or earthen ponds outside the animal housing, usually for periods less than one year.  |
| Uncovered<br>anaerobic<br>lagoon            | A type of liquid storage system designed and operated to combine waste stabilization<br>and storage. Lagoon supernatant is usually used to remove manure from the<br>associated confinement facilities to the lagoon. Anaerobic lagoons are designed with<br>varying lengths of storage (up to a year or greater), depending on the climate region,<br>the volatile solids loading rate, and other operational factors. The water from the<br>lagoon may be recycled as flush water or used to irrigate and fertilize fields. |
| Pit storage<br>below animal<br>confinements | Collection and storage of manure usually with little or no added water typically below a slatted floor in an enclosed animal confinement facility, usually for periods less than one year.  |
| Anaerobic<br>digester                       | Animal excreta with or without straw are collected and anaerobically digested in a large containment vessel or covered lagoon. Digesters are designed and operated for waste stabilization by the microbial reduction of complex organic compounds to CO2 and CH4, which is captured and flared or used as a fuel.  |
| Burned for fuel                             | The dung and urine are excreted on fields. The sun dried dung cakes are burned for fuel.  |
| Cattle and<br>Swine deep<br>bedding         | As manure accumulates, bedding is continually added to absorb moisture over a production cycle and possibly for as long as 6 to 12 months. This manure management system also is known as a bedded pack manure management system and may be combined with a dry lot or pasture.   |
| Composting –<br>In-vessel*                  | Composting, typically in an enclosed channel, with forced aeration and continuous mixing.   |
| Composting –<br>Static pile*                | Composting in piles with forced aeration but no mixing.   |
| Composting –<br>Intensive<br>windrow*       | Composting in windrows with regular (at least daily) turning for mixing and aeration.   |
| Composting –<br>Passive<br>windrow*         | Composting in windrows with infrequent turning for mixing and aeration.   |
| Aerobic<br>treatment                        | The biological oxidation of manure collected as a liquid with either forced or natural aeration. Natural aeration is limited to aerobic and facultative ponds and wetland systems and is due primarily to photosynthesis. Hence, these systems typically become anoxic during periods without sunlight.   |

\*Composting is the biological oxidation of a solid waste including manure usually with bedding or another organic carbon source typically at thermophilic temperatures produced by microbial heat production.

| Livestock Category (L)           | Livestock Typical Average Mass<br>(TAM) in kg |
|----------------------------------|---|
| Dairy cows (on feed)             | 604 <sup>6</sup>                              |
| Non-milking dairy cows (on feed) | 684 <sup>ª</sup>                              |
| Heifers (on feed)                | 476 <sup>b</sup>                              |
| Bulls (grazing)                  | 750 <sup>5</sup>                              |
| Calves (grazing)                 | 118 <sup>b</sup>                              |
| Heifers (grazing)                | 420 <sup>b</sup>                              |
| Cows (grazing)                   | 533 <sup>b</sup>                              |
| Nursery swine                    | 12.5 <sup>ª</sup>                             |
| Grow/finish swine                | 70 <sup>a</sup>                               |
| Breeding swine                   | 198 <sup>b</sup>                              |

**Table A.3.** Volatile Solids and Maximum Methane Potential by Livestock Category

| Livestock category (L) | VS⊾<br>(kg/day/1,000 kg mass)                                  | B <sub>o,L</sub> <sup>₺</sup><br>(m³ CH₄/kg VS added) |
|------------------------|--|---|
| Dairy cows             | See Appendix A, Table <del>s</del> <u>A.</u> 5. <del>a-e</del> | 0.24  |
| Non-milking dairy cows | 5.56   | 0.24  |
| Heifers                | See Appendix A, Table <del>s</del> <u>A.</u> 5. <del>a-e</del> | 0.17  |
| Bulls (grazing)        | 6.04 <sup>•</sup>  | 0.17  |

Table A.6.a Continued

| Composting -<br>Intensive windrow <sup>b</sup> | 0.5% | 1.0% | 1.5% | Judgment of IPCC Expert<br>Group and Amon et al. (1998).<br>MCFs are slightly less than<br>solid storage. Less<br>temperature dependant.   |
|--|------|------|------|--|
| Composting – Passive<br>windrow <sup>b</sup>   | 0.5% | 1.0% | 1.5% | Judgment of IPCC Expert<br>Group and Amon et al. (1998).<br>MCFs are slightly less than<br>solid storage. Less<br>temperature dependant.   |
| Aerobic treatment                              | 0%   | 0%   | 0%   | MCFs are near zero. Aerobic<br>treatment can result in the<br>accumulation of sludge which<br>may be treated in other<br>systems. Sludge requires<br>removal and has large VS<br>values. It is important to<br>identify the next management<br>process for the sludge and<br>estimate the emissions from<br>that management process if<br>significant. |

a Definitions for manure management systems are provided in Table A.1. b Composting is the biological oxidation of a solid waste including manure usually with bedding or another organic carbon source typically at thermophilic temperatures produced by microbial heat production.

#### Table A.6.b. Biogas Destruction Efficiency Default Values by Destruction Device

If available, the actual source test results for the measured methane destruction efficiency shall be used in place of the default methane destruction efficiency. Otherwise, <u>the</u> Offset pProject operators or aAuthorized pProject dDesignees hasve the option to use either the default methane destruction efficiencies provided, or the site specific methane destruction efficiencies as provided by a state or local agency accredited source test service provider, for each of the combustion devices used in the project case performed on an annual basis.

Table A.8. CO<sub>2</sub> Electricity Emission Factors

Source: U.S. EPA eGRID2007, Version 1.1 Year 2005 GHG Annual Output Emission Rates (December 2008). \* Converted from lbs CO<sub>2</sub>/MWh to metric tons CO<sub>2</sub>/MWH using conversion factor 1 metric ton = 2,204.62 lbs.

## Appendix B Data Substitution – Quantification Methodology

This appendix shows how to calculate <u>GHG</u> emission reductions when data integrity has been compromised either due to missing data points or a failed calibration. No data substitution is permissible for equipment such as thermocouples which monitor the proper functioning of destruction devices. Rather, the methodologies presented below are to be used only for the methane concentration and flow metering parameters.

### B.1 Missing Data

ARB expects that <u>offset</u> projects will have continuous, uninterrupted data for the entire verification period. However, ARB recognizes that unexpected events or occurrences may result in brief data gaps.

The following data substitution methodology may be used only for flow and methane concentration data gaps that are discrete, limited, non-chronic, and due to unforeseen circumstances. Data substitution can only be applied to methane concentration *or* flow readings, but not both simultaneously. If data is missing for both parameters, no reductions can be credited.

Further, substitution may only occur when two other monitored parameters corroborate proper functioning of the destruction device and system operation within normal ranges. These two parameters must be demonstrated as follows:

- 1. Proper functioning can be evidenced by thermocouple readings for flares, energy output for engines, etc.
- 2. For methane concentration substitution, flow rates during the data gap must be consistent with normal operation.
- 3. For flow substitution, methane concentration rates during the data gap must be consistent with normal operations.

If corroborating parameters fail to demonstrate any of these requirements, no substitution may be employed. If the requirements above can be met, the following substitution methodology may be applied:

| Duration of Missing Data | Substitution Methodology   |
|--------------------------|--|
| Less than six hours      | Use the average of the four hours immediately before and following the outage  |
| Six to 24 hours          | Use the 90% lower or upper confidence limit of the 24 hours prior to and after the outage, whichever results in greater conservativeness |
| One to seven days        | Use the 95% lower or upper confidence limit of the 72 hours prior to and after the outage, whichever results in greater conservativeness |
| Greater than one week    | No data may be substituted and no credits may be generated   |

Note: It is conservative to use the upper confidence limit when calculating emissions from the BCS (Equation 5.6); however it is conservative to use the lower confidence limit when calculating the total amount of methane that is destroyed in the BCS Equation 5.10.

# Appendix C Offset Project Listing Information

All information, if applicable, must be completed, even if the answer is also provided elsewhere;

- 1. Offset Pproject Nname
- 2. Offset Project Operator or Authorized Project Designee
- 3. Facility Oowner
- 4. Technical Cconsultants
- 5. Other parties with a material interest
- 6. Date of form completion
- 7. Form completed by (name, organization)
- Offset pProject Ddescription: 1-2 paragraphs (including type of digester & method of destruction)
- 9. <u>Offset p</u>Project <u>Ssite Aaddress</u> (including all governing jurisdictions & lat/lon)
- 10. Name & address of animal facility (if different from project site)
- 11. Description of type of facility (e.g. dairy, swine, etc.)
- 12. Offset pProject commencement date
- 13. Reporting period
- 14. Have any <u>GHG</u> reductions associated with the <u>offset</u> project ever been registered with or claimed by another registry or program, or sold to a third party prior to our listing? If yes, identify the registry or program (<u>V</u><u>v</u>intage and reporting period)
- 15. Is this <u>offset</u> project being implemented and conducted as the result of any law, statute, regulation, court order, or other legally binding mandate? If yes, explain.

### Appendix D Offset Project Data Report Information

- 1. Offset Pproject Nname
- 2. Offset Project Operator or Authorized Project Designee
- 3. Report Ddate
- 4. Contact information for Offset Project Operator or Authorize<u>d</u> Project Designee a. Address, email, phone number
- 5. Name of <u>lindividual Ccompleting Rreport</u>
- 6. Reporting Pperiod
- 7. Does offset project meet all local, state, or federal regulatory requirements
- 8. Offset Pproject Ccommencement Ddate
- 9. Facility Nname and Llocation
- 10. Is all the information in the <u>offset</u> project listing still accurate? If not provided updates.
- 11. Project Bbaseline Eemissions
- 12. Project Eemissions
- 13. Total <u>GHG Rr</u>eductions
